Floricultural crops all over the world are challenged by a number of insect and mite pests. The pest scenario is changing, and with climate change the instances of new pest incidences have become a more common problem. Like other crops, the intensive cultivation of commercial flowers has accentuated pest problems, as farmers tend to use more agricultural chemicals, which, in turn, increase the problems of pesticide resistance, pest resurgence, and residues leading to health hazards. This volume, *Advances in Pest Management in Commercial Flowers*, looks at the major challenges and improvements in this growing area today. It first provides an informative overview of worldwide pests of important commercial flowers. It explores a number of important issues in this area, such as the role of climate change on insect pests of commercial flowers and the synthetic chemicals and their possible harmful effects on the environment.

International trade in high value perishables has grown enormously in the past few decades. In the developed world consumers now expect to be able to eat perishable produce from all parts of the world, and in most cases throughout the year. Perishable plant products are, however, susceptible to physical damage and often have a potential storage life of only a few days. Given their key importance in the world economy, *Crop Post-Harvest Science and Technology: Perishables* devotes itself to perishable produce, providing current and comprehensive knowledge on all the key factors affecting post-harvest quality of fruits and vegetables. This volume focuses explicitly on the effects and causes of deterioration, as well as the many techniques and practices implemented to maintain quality through correct handling and storage. As highlighted throughout, regular losses caused by post-harvest spoilage of perishable products can be as much as 50%. A complete understanding, as provided by this excellent volume, is therefore vital in helping to reduce these losses by a significant percentage. Compiled by members of the world-renowned Natural Resources Institute at the United Kingdom's University of Greenwich, with contributions from experts around the world, this volume is an essential reference for all those working in the area. Researchers and upper-level students in food science, food technology, post-harvest science and technology, crop protection, applied biology and plant and agricultural sciences will benefit from this landmark publication. Libraries in all research establishments and universities where these subjects are studied and taught should ensure that they have several copies for their shelves.

An economist's view of Hawaii's agriculture, its history, present status, and future prospects. The author presents a wealth of essential information on Island crops, and discusses significant agricultural trends in down-to-earth language for farmers, specialists, students, and the general public. Part One surveys the historical background of today's economy and the development of various agricultural industries now commercially important in the Islands. Hawaii's unique farm economy presents local problems which mainland methods cannot solve; expanding diversified agriculture is viewed by the author as an important way to strengthen the Island's economic position. Part Two is a detailed discussion of each diversified agricultural industry; vegetables, flowers and foliage, fruits and macadamia nuts, coffee, livestock, poultry, beekeeping, and others. The author advocates advanced production methods and greater diversification to increase farm income and, at the same time, develop export crops.

Annotation Symposium on environmentally sustainable agricultural development. Twenty-seven specialists discuss policies and techniques for advancing agricultural development and protecting the environment. The discussions on agricultural management examine how the environment is affected by population growth, conservation tillage, moisture management, soil fertility, and biological nitrogen fertilization. Several strategies offer ways to raise the productivity of women farmers, target women for extension programs, and address fuel issues of special concern to women. The symposium also explores the relationship between poverty and agricultural resource management. Key topics include the effects of deforestation, conservation, and population growth on poverty and the ways in which supply-led credit could be used to rehabilitate the environment.
