In *Blue Sky Dream: A Memoir of America's Fall from Grace*, award-winner David Beers offers a powerful, personal vision of the rise and fall of the American middle class. Here is a dazzling literary chronicle of a family, a people, and a nation: the "blue sky tribe" of ever-optimistic middle-class Americans who believed in something called the American Dream, then woke up one day to discover it was gone. *Blue Sky Dream* is a book incredibly rich in ideas, in ways of seeing the recent past with stunning clarity. David Beers explores issues that define our times—downsizing,

middle-class anxiety, the profound anger with government, the sense that something has gone awry with the United States—with such skill, personal immediacy, and compassion that readers will see their own histories in his prose. *Blue Sky Dream* can rightly be called a communal memoir, because in telling his family's tale—growing tensions and disillusionment in their suburban paradise, a son rejecting his parents' values, one sudden and inexplicable moment of violence—Beers tells the story of his people, the blue sky tribe "who imagined ourselves to be living the inevitable future, and are very surprised today to discover we were but a strange and aberrant moment that is now receding into history."

As the biomedical engineering field expands throughout the world, clinical engineers play an ever more important role as the translator between the worlds of the medical, engineering, and business professionals. They influence procedure and policy at research facilities, universities and private and government agencies including the Food and Drug Administration and the World Health Organization. Clinical engineers were key players in calming the hysteria over electrical safety in the 1970s and Y2K at the turn of the century and continue to work for medical safety. This title brings together all the important aspects of Clinical Engineering. It provides the reader with prospects for the future of clinical engineering as well as guidelines and standards for best practice around the world.

"Affective Health and Masculinities in South Africa explores how different masculinities modulate substance use, interpersonal violence, suicidality, and AIDS as well as recovery cross-culturally. With a focus on three male protagonists living in very distinct urban areas of Cape Town, this comparative ethnography shows that men's struggles to become invulnerable increase vulnerability. Through an analysis of masculinities as social assemblages, the study shows how affective health problems are

tied to modern individualism rather than African 'tradition' that has become a cliché in Eurocentric gender studies. Affective health is conceptualized as a balancing act between autonomy and connectivity that after colonialism and apartheid has become compromised through the imperative of self-reliance. This book provides a rare perspective on young men's vulnerability in everyday life that may affect the reader and spark discussion about how masculinities in relationships shape physical and psychological health. Moreover, it shows how men change in the face of distress in ways that may look different than global health and gender transformative approaches envision. Thick descriptions of actual events over the life course make the study accessible to both graduate and undergraduate students in the social sciences. Contributing to current debates on mental health and masculinity, the volume will be of interest to scholars from a number of disciplines including anthropology, gender studies, African studies, psychology and global health"--

Making Mice blends scientific biography, institutional history, and cultural history to show how genetically standardized mice came to play a central role in contemporary American biomedical

research. Karen Rader introduces us to mouse "fanciers" who bred mice for different characteristics, to scientific entrepreneurs like geneticist C. C. Little, and to the emerging structures of modern biomedical research centered around the National Institutes of Health. Throughout *Making Mice*, Rader explains how the story of mouse research illuminates our understanding of key issues in the history of science such as the role of model organisms in furthering scientific thought. Ultimately, genetically standardized mice became icons of standardization in biomedicine by successfully negotiating the tension between the natural and the man-made in experimental practice. This book will become a landmark work for its understanding of the cultural and institutional origins of modern biomedical research. It will appeal not only to historians of science but also to biologists and medical researchers.
