This book, written by recognized experts in the field, is intended for designers of RF or microwave passive integrated circuits. It describes methods used for modeling passive circuits using the most common numerical analysis techniques (the method of moments, finite element methods, FDTD, TLM), and pays particular attention to propagation phenomena. Interconnections and packaging modeling are included, as well as an original method for multi-scale circuit modeling.

Characterization and measurement methods in the time and frequency domains are the subject of two very detailed chapters. Measurement errors using Vector Network Analyzer (VNA) and appropriate corrections are detailed and the divergences between all the various parameters S, Z, Y, h, T, ABCD are given. Time domain reflectometry and its use are also covered in detail.

RF and Microwave Circuits, Measurements, and Modeling John Wiley & Sons

In the high frequency world, the passive technologies required to realize RF and microwave functionality present distinctive challenges. SAW filters, dielectric resonators, MEMS, and waveguide do not have counterparts in the low frequency or digital environment. Even when conventional lumped components can be used in high frequency applications, their behavior does not resemble that observed at lower frequencies. RF and Microwave Passive and Active Technologies provides detailed information about a wide range of component technologies used in modern RF and microwave systems. Updated chapters include new material on such technologies as MEMS, device packaging, surface acoustic wave (SAW) filters, bipolar junction and heterojunction transistors, and high mobility electron transistors (HMETs). The book also features a completely rewritten section on wide bandgap transistors.
