Training, performance and dynamic capabilities: New insights from absorptive, innovative, adaptative and learning capacities Berghahn Books

Tobacco use by adolescents and young adults poses serious concerns. Nearly all adults who have ever smoked daily first tried a cigarette before 26 years of age. Current cigarette use among adults is highest among persons aged 21 to 25 years. The parts of the brain most responsible for cognitive and psychosocial maturity continue to develop and change through young adulthood, and adolescent brains are uniquely vulnerable to the effects of nicotine. At the request of the U.S. Food and Drug Administration, Public Health Implications of Raising the Minimum Age of Legal Access to Tobacco Products considers the likely public health impact of raising the minimum age for purchasing tobacco products. The report reviews the existing literature on tobacco use patterns, developmental biology and psychology, health effects of tobacco use, and the current

landscape regarding youth access laws, including minimum age laws and their enforcement. Based on this literature, the report makes conclusions about the likely effect of raising the minimum age to 19, 21, and 25 years on tobacco use initiation. The report also quantifies the accompanying public health outcomes based on findings from two tobacco use simulation models. According to the report, raising the minimum age of legal access to tobacco products, particularly to ages 21 and 25, will lead to substantial reductions in tobacco use, improve the health of Americans across the lifespan, and save lives. Public Health Implications of Raising the Minimum Age of Legal Access to Tobacco Products will be a valuable reference for federal policy makers and state and local health departments and legislators.

This report presents indicators traditionally used to monitor the information society and complements them with experimental indicators that provide insight into areas of policy interest. *The 2010 Nagoya Protocol on Access and Benefit-sharing in Perspective* Berghahn Books
 The debate about access to scientific research raises questions about the current effectiveness of

scholarly communication processes. This book explores, from an independent point of view, the current state of the STM publishing market, new publishing technologies and business models as well as the information habit of researchers, the politics of research funders, and the demand for scientific research as a public good. The book also investigates the democratisation of science including how the information needs of knowledge workers outside academia can be embraced in future.

Jewish historiography tends to stress the religious, cultural, and political aspects of the past. By contrast the "economy" has been pushed to the margins of the Jewish discourse and scholarship since the end of the Second World War. This volume takes a fresh look at Jews and the economy, arguing that a broader, cultural approach is needed to understand the central importance of the economy. The very dynamics of economy and its ability to function depend on the ability of individuals to interact, and on the shared values and norms that are fostered within ethnic communities. Thus this volume sheds new light on the interrelationship between religion, ethnicity,

culture, and the economy, revealing the potential of an “economic turn” in the study of history.

This volume proposes an interdisciplinary framework that views attention from a particular angle: as a means of accessing, that is, disclosing the world in a practical and meaningful way. Moreover, it investigates how this access is concretely mediated (by technology, culture, environmental conditions). The book is structured in the following two parts: 1) Attention and Access The first section is concerned with attention as such. What is attention and what does it do? A common thread between the expected contributions addresses attention as a directional disclosing process, opening up a possibility of access to the world. This section brings contributions from a cognitive psychology/neuroscience into dialogue with phenomenology and philosophy of mind; and links attention research to new paradigms, such as predictive coding, and 4e cognition. 2) Attention and Mediation The second section tackles the question of how this disclosing process may work. Concrete disclosing is always framed by different factors and frames the world. The contributions in this section spell out the different ways in which attention is mediated and shaped by technology, situations, sociality etc., and the ways in which attention mediates our access to the world.

A scientific publication system needs to provide two basic services: access and evaluation. The traditional publication system restricts the access to papers by requiring payment, and it restricts the evaluation of papers by relying on just 2-4 pre-publication peer reviews and by keeping the reviews secret. As a result, the current system suffers from a lack of quality and transparency of the peer-review evaluation process, and the only immediately available indication of a new paper’s quality is the prestige of the journal it appeared in. Open access is now widely accepted as desirable and is slowly beginning to become a reality. However, the second essential element, evaluation, has received less attention. Open evaluation, an ongoing post-publication process of transparent peer review and rating of papers, promises to address the problems of the current system. However, it is unclear how exactly such a system should be designed. The evaluation system steers the attention of the scientific community and, thus, the very course of science. For

better or worse, the most visible papers determine the direction of each field and guide funding and public policy decisions. Evaluation, therefore, is at the heart of the entire endeavor of science. As the number of scientific publications explodes, evaluation and selection will only gain importance. A grand challenge of our time, therefore, is to design the future system, by which we evaluate papers and decide which ones deserve broad attention. So far scientists have left the design of the evaluation process to journals and publishing companies. However, the steering mechanism of science should be designed by scientists. The cognitive, computational, and brain sciences are best prepared to take on this task, which will involve social and psychological considerations, software design, and modeling of the network of scientific papers and their interrelationships. This Research Topic in Frontiers in Computational Neuroscience collects visions for a future system of open evaluation. Because critical arguments about the current system abound, these papers will focus on constructive ideas and comprehensive designs for open evaluation systems. Design decisions include: Should the reviews and ratings be entirely transparent, or should some aspects be kept secret? Should other information, such as paper downloads be included in the evaluation? How can scientific objectivity be strengthened and political motivations weakened in the future system? Should the system include signed and authenticated reviews and ratings? Should the evaluation be an ongoing process, such that promising papers are more deeply evaluated? How can we bring science and statistics to the evaluation process (e.g. should rating averages come with error bars)? How should the evaluative information about each paper (e.g. peer ratings) be combined to prioritize the literature? Should different individuals and organizations be able to define their own evaluation formulae (e.g. weighting ratings according to different criteria)? How can we efficiently transition toward the future system? Ideally, the future system will derive its authority from a scientific literature on community-based open evaluation. We hope that these papers will provide a starting point.

Since the late nineteen sixties, transnational adoption has emerged as a global phenomenon. Due to a sharp decline in infants being made available for adoption locally, involuntarily childless couples in Western Europe and North America who wish to create a family, have to look to look to countries in the poor South and Eastern Europe. The purpose of this book is to locate transnational adoption within a broad context of contemporary Western life, especially values concerning family, children and meaningful relatedness, and to explore the many ambiguities and paradoxes that the practice entails. Based on empirical research from Norway, the author identifies three main themes for analysis: Firstly, by focusing on the perceived relationship between biology and sociality, she examines how notions of child, childhood and significant relatedness vary across time and space. She argues that through a process of kinning, persons are made into kin. In the case of adoption, kinning overcomes a dominant cultural emphasis placed upon biological connectedness. Secondly, it is a study of the rise of expert knowledge in the understanding of 'the best interest of the child', and how the part played by the 'psycho.technocrats' effects national and international policy and practice of transnational adoption. Thirdly, it shows how transnational adoption both depends upon and helps to foster the globalisation of Western rationality and morality. The book is an original contribution to the anthropological study of kinship and globalisation.

This book explores how the global financial and European sovereign debt crises have forced small-and-medium-sized businesses (SMEs) to reassess and adapt their funding strategies. At the heart of the matter is the worsening access to bank credit for such enterprises. Through this discussion

we learn how crucial an understanding of SME-financing is to policy makers, in light of the fact that SMEs dominate the business landscape in Europe and are the main drivers of employment, growth and innovation in the European economy. Contributing chapters present expert analysis and investigate many topics including the problems faced by SMEs in accessing bank credit and the cost of funding and its determinants. Particular attention is also given to how credit-constrained enterprises may reformulate their funding strategies by employing alternative, non-bank, financial resources, and how regulators could support SMEs in broadening and improving their funding opportunities.
