## PETERSEN CASSIUS

*A History of Transplantation Immunology* Academic Press

The distinction between molecular immunology and immunobiology is necessarily arbitrary. The most rapid progress is usually made in the blurred area between the two, when the chemist is aware of the full significance of the biological problems, and the biologist is alert to the contribution that a knowledge of molecular structure can be made to their solution. The range of scientific disciplines able to contribute to research in immunology, which this approach brings, is reflected in the present volume. Protein chemists worked out the arrangement of the polypeptide chains and the amino acid sequences of antibodies and X-ray crystallographers the three dimensional structure, but more precise definition of the amino acid side chain positions in the combining site is required for an understanding of the subtleties of antibody specificity. That this can be achieved with physical techniques such as nuclear magnetic resonance has been shown by

R. A. Dwek, and in his chapter he summarizes these results with a minimum of technical detail.

The immune response has been shown to be dependent on complex cellular interactions and further progress will be facilitated by investigation of the molecular basis of these interactions. This necessitates study of the structure and organization of the molecules in the surfaces of lymphocytes and other cells.

**Progress in Immunology** Elsevier

Researchers have recently made tremendous progress in the area of mucosal immunology, greatly increasing our understanding of the common mucosal immune system, mucosal infections, and oral immunization. However, this research has not previously been made available in a single work. In its large 8 1/2" x 11" format, Handbook of Mucosal Immunology covers the entire spectrum of mucosal immunity and is organized in two main sections to present the basic biology of the common mucosal immune system and the immune responses of the mucosae. The first section provides an introduction and historical perspective of the mucosal immune system and includes comprehensive discussion of the development and physiology of mucosal defense. It discusses

such topics as the structure and function of the mucosal epithelium, characteristics of mucosal-associated lymphoid tissue (MALT), Peyer's patches, and concepts of mucosal vaccines. The second section focuses on the secretory immune system with special reference to mucosal diseases in the digestive (GALT), respiratory (BALT), and genitourinary tracts. This information is especially important in light of the current interest in the mechanisms, transmission, and prevention of infectious diseases such as AIDS, hepatitis, and tuberculosis. Virtually all chapters have been authored by the original investigators responsible for key observations on which current concepts are based. This handbook will be an invaluable resource for a diverse group of both researchers and practicing clinicians. Molecular biologists, immunologists, veterinarians, public health workers, physicians in specialties from pediatrics to pulmonology, and graduate students of mucosal immunology will all find this handbook the most complete work on the subject.

*Essentials of Mucosal Immunology* John Wiley & Sons

This unique book provides a comprehensive and comparative guide to the immune systems of major vertebrate species, including domestic and wild animals of veterinary or medical interest,

fish and amphibia. Data in this essential reference work has been compiled by world-renowned editors and an international group of authors. For each species, the information is presented in a structured 'user-friendly' format allowing easy cross reference and comparison between the various species. This book will be considered the definitive reference work on vertebrate immunology and will be essential for scientists and professionals working in Immunology, Vaccinology or with Animal Models, for students of Veterinary or Human Medicine, Biology and researchers in Comparative Medicine and Physiology. Each section, devoted to a major animal group covers: Lymphoid organs and their anatomical disposition Leukocytes and their markers Leukocyte traffic and associated molecules Cytokines T cell receptors Immunoglobulins MHC antigens Ontogeny of the immune system Passive transfer of immunity Neonatal immune responses Non-specific immunity Complement system Mucosal immunity Immunodeficiencies Tumours of the immune system Autoimmunity

*Clinical Immunology* Academic Press

The consequences for diseases involving the immune system such as AIDS, and chronic inflammatory diseases such as bronchial asthma, rheumatoid arthritis, and atherosclerosis, now account for a considerable economic burden to governments worldwide. In response there has been an enormous research effort investigating the basic mechanisms underlying such diseases, and a tremendous drive to identify novel therapeutic applications for their preventions and treatment. Though a plethora of immunological studies have been published in recent years, little has been written about the implications of such research for drug development. As a consequence, this area has not gained the prominence of other new fields such as molecular pharmacology or neuropharmacology, and a focal information source for many pharmacologists interested in diseases of the immune system remains unpublished. The Handbook of Immunopharmacology series provides such a source through the commissioning of a comprehensive collection of volumes on all aspects immunopharmacology. Editors have been sought after for each volume who are not only active in their respective areas of expertise, but who also have distinctly pharmacological bias to their research. The series follows three main themes, each represented by volumes on individual component topics. The first covers each of the major cell types and classes of inflammatory responses that can affect them ("Systems"). The third covers different classes of diseases as well as those under development ("Drugs").

*Asthma and Rhinitis* Academic Press

Clinical Immunology not only introduces the reader to the human immune system, it also covers immunology from clinical manifestation to therapeutic approaches in a wide range of conditions. Each chapter describes an introduction, the clinical manifestations, the immunopathogenesis, diagnosis, lab tests and therapeutic approaches. The book guides clinicians, researchers and students to a better understanding of the matters of immunologic-based diseases that can lead to better decision-making for patients. Because of the growing knowledge regarding the function of immune system in health and disease conditions, clinicians, researchers and students increasingly require an exclusive scientific reference to guide them on matters of immunologic-based diseases. Accordingly, despite the existence of numerous high quality references in basic and cellular/molecular immunology which deeply explain different immunologic mechanisms, there is still a knowledge gap in the field of clinical immunology. - Provides essentials, updates clinical knowledge regarding immune system diseases, and cover different aspects of clinical immunology, from immunopathogenesis and etiology to diagnosis and treatment - Introduces the most advanced approaches and laboratory tests as well as their interpretation in the diagnosis of immune system disorders - Focuses on the practical use of clinical immunology, from bedside to bench and vice versa

**Mycoplasma pneumoniae Clinical Manifestations, Microbiology, and Immunology** Springer

In 1992, the Falk Symposium No. 70 dealt with the topic 'Immunology and Liver'. At that time basic mechanisms of immunology as well as immunopathogenetic mechanisms in viral and autoimmune liver diseases were discussed. Now, 7 years later, the Falk Symposium No. 114, held in Basel, Switzerland, October 20-21 1999 (Part I of the Basel Liver Week 1999), focused on immunology in autoimmune liver diseases. In the first section basic mechanisms of autoimmunity are presented, including the relevance of superantigens and the role of apoptosis. A further topic is the latest developments concerning animal models for autoimmune diseases. Recently the International Autoimmune Hepatitis Group newly defined and reclassified the syndrome of autoimmune hepatitis. Autoimmune hepatitis is now identified and studied in all parts of the world,

including Asia and South America. A special variant of autoimmune hepatitis was identified as one organ manifestation of the autoimmune polyendocrine syndrome type 1, a genetic disease caused by mutations in a single transcription factor. Drug- and hepatitis-virus induced immune mediated liver diseases may serve as models for nonhepatic immune mediated disorders. DNA technology has increased our knowledge of the immunogenetic background of autoimmune liver diseases. Among the cholestatic immune mediated liver diseases, significant progress has been made concerning primary biliary cirrhosis, in particular regarding the identification of mitochondrial antigens and the characterisation of the immune reactions directed at them. The involvement of infectious agents in PBC as well as the definition of overlap syndromes is a particular focus for basic and clinical research in this area. Concerning the therapy of autoimmune liver diseases, corticosteroids and azathioprin remain the state of the art for autoimmune hepatitis, while bile acids have become well established in treatment of primary biliary cirrhosis as well as primary sclerosing cholangitis. New drugs in the future will include topical steroids such as budesonide and new immunosuppressive agents like mofetil/mycophenolate. Liver transplantation is the treatment of choice for end stage liver diseases; all autoimmune liver diseases are among the best candidates for liver transplantation. Hopefully, new therapeutic strategies based on the results obtained from experimental models will become everyday clinical practice in the next decade. Therefore this symposium concludes with a discussion.

**Advances in Immunology** Springer

Translational Immunology: Mechanisms and Pharmacologic Approaches highlights and summarizes the most important advances in human immunology, clinical translations, new tools to analyze therapeutic targets, and new pharmacological approaches for autoimmunity, inflammatory disorders, and cancer. The book is an essential resource for those seeking to understand the potential translational applications of burgeoning studies in human immunology, helping readers make sense of the existing and emerging scientific advances. The book grounds fundamental science in the translational realm, providing insights from world renowned researchers at the top of their game in their respective fields, in both industry and academic settings. Readers will gain an understanding of the rationale and mechanisms underlying current and emerging pharmacologic approaches for interventional immunology, the gaps therein, and new ideas for better and safer therapeutic approaches, and physicians will glean information about pharmacological limitations in altering disease progression and complications. This reference on the translational realization of the burgeoning findings in immunology provides a go-to reference for experienced professional clinicians, researchers, industry scientists, and those seeking more information on the field. - Delivers comprehensive coverage of seminal human immunology discoveries and the resulting impact on therapeutic strategies - Presents potential novel targets and approaches for clinical applications in organ specific and systemic autoimmunity, transplant rejection, cancer, and vaccine development - Discusses lessons learned from successful and failed clinical trials with specific interventions, including pharmacological issues and limitations, and complications due to immunosuppression - Provides information on new strategies and outstanding issues that should be addressed in future research

**Transgenesis and Targeted Mutagenesis in Immunology** Frontiers E-books

Progress in Immunology: First International Congress of Immunology is a collection of papers and summaries of the workshops conducted at the First International Congress of Immunology. The proceedings review significant advances that have been made in the field of immunology and covers topics ranging from the structure and genetics of antibodies to lymphocyte membranes and the role of antibodies and complexes in immune tissue damage. Cell cooperation in the immune response is also examined. This volume is organized into 15 sections and begins with a discussion on the structure of immunoglobulins and results of experiments which support the domain hypothesis and the evolution of immunoglobulins by gene duplication, along with the presence of genetic markers in V regions. The reader is then introduced to expansion and contraction in the evolution of immunoglobulin gene pools; receptors for C3 on B lymphocytes and their possible role in the immune response; and subpopulations of thymus cells and thymus-derived lymphocytes. The remaining sections focus on effector mechanisms of cell-mediated immunity; genetic control of immune responsiveness; immune disorders in humans such as glomerulonephritis and rheumatoid arthritis; and viruses involved in immunopathology. This book is dedicated to immunologists.

*Current Advances in Immunology* John Wiley & Sons

THE authoritative guide for clinical laboratory immunology For nearly 50 years, the Manual of

Molecular and Clinical Laboratory Immunology has been the premier resource for laboratories, students, and professionals involved in the clinical and technical details of diagnostic immunology testing. The 9th Edition continues its tradition of providing comprehensive clinical and technical information on the latest technologies used in medical and diagnostic immunology. Led by a world-renowned group of authors and editors, this new edition reflects substantial changes aimed at improving and updating the Manual's utility while reflecting the significant transformations that have occurred since the last edition, including the revolution of gene editing and the widespread adoption of molecularly engineered cellular therapies. Topical highlights include: Laboratory Management: three new chapters cover essential aspects of quality assurance, quality improvement, and quality management, aligning with the increasingly stringent and demanding regulatory environment. Inborn Errors of Immunity: the primary immunodeficiency section has been completely updated to align with the latest International Union of Immunological Societies' classifications of inborn errors of immunity. Functional Cellular Assays: expanded content includes detailed discussions on various functional assays critical for modern immunologic testing. Autoimmune Diseases: expanded chapters on systemic and organ-specific autoimmune disorders, including new chapters on Sjögren's syndrome and deficiency of ADA2, as well as significant updates on organ-specific autoimmune diseases. Transplantation Immunology: updated chapters detail the assessment of immune reconstitution and ABO testing, reflecting latest practices. The 9th Edition of the Manual of Molecular and Clinical Laboratory Immunology serves as an invaluable resource for laboratory directors, clinicians, laboratory managers, technologists, and students. It provides critical insights into the selection, application, and interpretation of immunologic tests, offering practical guidance on troubleshooting, clinical application, and an understanding of test limitations. This comprehensive and up-to-date manual remains an essential tool for anyone involved in the diagnosis, evaluation, and management of immune-mediated and immune system-related disorders.

**HIV Molecular Immunology** Academic Press

Most comprehensive book to date on insect immunocytes and other hemocytes Computer image analysis of immunocyte serial sections Why insects are immune to HIV Structural and functional similarities between certain components of the immune systems of arthropods and vertebrates Applications of Limulus Amebocyte Lysate (LAL) to detect endotoxin contamination in pharmaceuticals, medical devices, clinical diagnosis, and hygienic control  
**Immunology of Insects and Other Arthropods** Elsevier  
This issue of Immunology and Allergy Clinics of North America, guest edited by Drs. Robert Wood, Pamela Guerrero, and Corinne Keet, is devoted to Pediatric Allergy. Articles in this issue include: Role of the Environment in the Development of Allergic Disease; Genetics of Allergic Diseases; Optimizing the Diagnosis of Allergic Disorders; Anaphylaxis and Urticaria; Food Allergy; Epidemiology and Natural History; Inner City Asthma; Potential Treatments for Food Allergy; Eosinophilic Esophagitis; Atopic Dermatitis; Pediatric Asthma - Guidelines-based Care; Asthma - The Interplay Between Viral Infections and Allergic Diseases; Allergic Rhinitis; and Drug and Vaccine Allergy.

*Pediatric Allergy. An Issue of Immunology and Allergy Clinics of North America* Academic Press

Mycoplasma pneumoniae (Mp) is a major human pathogen that causes both upper and lower respiratory infections, and is one of the leading causes of community acquired pneumonia (CAP), accounting for 11-15% of CAP throughout the world. Additionally it is known to induce an inflammatory process which depends on several mechanisms such as virulence of Mp (lipoproteins, community acquired respiratory distress syndrome (CARDS) toxin, oxidative products) and host defenses (cellular immunity and humoral immunity). Although it is a common pathogen, the pathogenesis for Mp infections is not yet fully understood. From the clinical point of view, since the pioneer studies in the 1960s and 1970s on the clinical presentation of Mp associated disease, the diagnostics approaches have changed dramatically leading to a better understanding of the clinical presentation and new issues have emerged - such as antibiotics resistance. The purpose of this Frontiers ebook is to thoroughly review and discuss the clinical presentation in view of the improved diagnostics, microbiological and immunological analysis of Mp infections, with focus on the history of Mp, clinical features of disease, bacterial structure of Mp and mechanism of gliding, clinical and laboratory diagnostics, the role of lipoproteins and Toll-like receptor, CARDS toxin, subtyping of Mp isolates and genome analysis, macrolide resistance and treatment.

*NETosis: At the Intersection of Cell Biology, Microbiology, and Immunology* Academic Press

Current Advances in Immunology presents the advances in immunology in an easy-to-use format.

The book is split into 51 main areas that are further classified into sections. Where appropriate, cross-referencing to other sections is given. The text also provides a guide on how to use the book. Papers included in the book focus on a variety of topics ranging from immunoglobulins and antigens to interferons, lymphocytes, leukocytes, and macrophages as well as natural killer cells, Langerhans cells, dendritic cells, lymphoid tissue, and humoral mediators of immune responses and immunomodulators. Other papers discuss blood groups, transplantation, anti-bacterial immunity, chronic inflammation, delayed hypersensitivity, and contact sensitivity. Immunodeficiency, immune complexes, tumor immunity, immunopharmacology and immunotoxicology, and the link between nutrition and immunity are also explored. A section devoted to psychoneuroimmunology focuses on the effect of stress on graft-versus-host reaction; immunological response to stress in agoraphobia and panic attacks; and anti-beta-endorphin immunoglobulin G in humans. This book will be of interest to working scientists in the field of immunology.

Cumulative List of Organizations Described in Section 170 (c) of the Internal Revenue Code of 1954  
Springer Science & Business Media

Investigations into the field of immunology are rapidly expanding with the use of genetically altered mice at the embryonic stage. This breakthrough laboratory guide provides a complete study of transgenesis and targeted mutagenesis in laboratory mice that will be valued by researchers looking for fresh observations and interpretations when designing future experiments. Special Features Include: Contributions of two Nobel Prize winners Addresses the use of mouse models in studying the immune system Targets gene distribution in embryonic stem cells and their introduction into blastocyte mice models Analyzes the in vivo functional loss of embryonic cells A practical, useful guidebook for individual researchers, laboratories, and libraries  
Cumulated Index Medicus Nova Publishers

The second edition of this highly acclaimed text has been extensively revised and greatly expanded to reflect the considerable advances made in our understanding of the mechanisms of asthma and rhinitis. Containing the contributions of 242 experts of international standing, presented in 133 chapters, *Asthma and Rhinitis* provides an up-to-date, authoritative reference for both the clinician and scientist. The global approach given in this book mirrors the universal approach to the understanding of allergic disease. The editors have carried out a thorough and radical revision of the content by adding 6 new sections and 44 new chapters. Most of this expansion is due to greatly increased coverage of the clinical aspects of asthma, with new sections on childhood asthma and on drug treatment (each drug class has its own chapter). Also, the expansion of research into the genetic basis of asthma has necessitated a whole new section on Genetics, comprising some six chapters. There are also new chapters on adult-onset asthma and the relationship of asthma to sinusitis. A new section on Asthma in Special Circumstances includes chapters on asthma in pregnancy, asthma and surgery, asthma in the elderly and asthma in the context of critical care. In bringing the Second Edition fully up to date, the book has inevitably increased in size, and is now presented in two volumes. The second edition of *Asthma and Rhinitis*

will continue the tradition of its predecessor of providing an up-to-the-minute reference for all those involved in the management of, and research into, asthma and rhinitis.

Advances in Immunology Academic Press

*Mucosal Immunology*, now in its fourth edition, is the only comprehensive reference covering the basic science and clinical manifestations of mucosal immunology. Most infectious agents enter the body through the various mucous membranes, and many common infections take place in or on mucous membranes, making this subject an area of singular importance in the field of immunology. This book contains new research data, exceptional illustrations, original theory, a new perspective, and excellent organization. It covers immune system topics, such as inductive and effector tissues and cells, and development and physiology of the mucosal barrier; diseases in the digestive system, respiratory tract, and genitourinary tract; and immunodeficiency. - The most comprehensive text on mucosal immunology from internationally recognized experts in the field - Includes exceptional color illustrations, new research data, original theory and information on all mucosal diseases - Contains nine new chapters and an expanded appendix

Encyclopedia of Bone Biology Academic Press

*Encyclopedia of Bone Biology*, Three Volume Set covers hot topics from within the rapidly expanding field of bone biology and skeletal research, enabling a complete understanding of both bone physiology and its relation to other organs and pathophysiology. This encyclopedia will serve as a vital resource for those involved in bone research, research in other fields that cross link with bone, such as metabolism and immunology, and physicians who treat bone diseases. Each article provides a comprehensive overview of the selected topic to inform a broad spectrum of readers from advanced undergraduate students to research professionals. Chapters also explore the latest advances and hot topics that have emerged in recent years, including the Hematopoietic Niche and Nuclear Receptors. In the electronic edition, each chapter will include hyperlinked references and further readings as well as cross-references to related articles. Incorporates perspectives from experts working within the domains of biomedicine, including physiology, pathobiology, pharmacology, immunology, endocrinology, orthopedics and metabolism Provides an authoritative introduction for non-specialists and readers from undergraduate level upwards, as well as up-to-date foundational content for those familiar with the field Includes multimedia features, cross-references and color images/videos

The Journal of Immunology Frontiers Media SA

*Advances in Immunology* presents current developments as well as comprehensive reviews in immunology. Articles address the wide range of topics that comprise immunology, including molecular and cellular activation mechanisms, phylogeny and molecular evolution, and clinical modalities. Edited and authored by the foremost scientists in the field, each volume provides up-to-date information and directions for future research. PRAISE FOR THE SERIES "The series which all immunologists need." —THE PHARMACEUTICAL JOURNAL "Advances in Immunology must find itself among the most active volumes in the libraries of our universities and institutions."

—SCIENCE "Deserves a permanent place in biomedical libraries as an aid in research and in teaching." —JOURNAL OF IMMUNOLOGICAL METHODS "A provocative and scholarly review of research." —JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION "Provides an extremely valuable source of reference and many stimulating ideas...the main repository of information in a rapidly developing subject." —THE LANCET "Provides unrivaled value in both academic and fiscal terms and should be purchased by hard pressed librarians as a major priority to be jealously defended." —JOURNAL OF MEDICAL MICROBIOLOGY "A very valuable serial publication...no serious student of immunology can afford to be without it." —ARCHIVES OF BIOCHEMISTRY AND BIOPHYSICS  
**Handbook of Vertebrate Immunology** Lippincott Williams & Wilkins

NETosis is a unique form of cell death that is characterized by the release of decondensed chromatin and granular contents to the extracellular space. The initial observation of NETosis placed the process within the context of the innate immune response to infections. Neutrophils, the most numerous leukocytes that arrive quickly at the site of an infection, were the first cell type shown to undergo extracellular trap formation. However, subsequent studies showed that other granulocytes are also capable of releasing nuclear chromatin following stimulation. The extracellular chromatin acts to immobilize microbes and prevent their dispersal in the host. Bacterial breakdown products and inflammatory stimuli induce NETosis and the release of NETs requires enzyme activities. Histones in NET chromatin become modified by peptidylarginine deiminase 4 (PAD4) and cleaved at specific sites by proteases. NETs serve for attachment of bactericidal enzymes including myeloperoxidase, leukocyte proteases, and the cathelicidin LL-37. While the benefit of NETs in an infection appears clear, NETs also figure prominently at the center of various pathologic states. Therefore, it is important for NETs to be efficiently cleared; else digestive enzymes may gain access to tissues where inflammation takes place. Persistent NET exposure at sites of inflammation may lead to a further complication: NET antigens may provoke acquired immune responses and, over time, could initiate autoimmune reactions. Recent studies identified aberrant NET synthesis and/or clearance in inflammatory/autoimmune conditions such as systemic lupus erythematosus (SLE), psoriasis, ANCA-positive vasculitis, gout and Felty's syndrome. In the case of SLE, for example, it appears that LL-37 exposed in the NETs may be a significant trigger of type I Interferon responses in this disease. Recent evidence also implicates aberrant NET formation in the development of endothelial damage, atherosclerosis and thrombosis. NETosis is thus of interest to researchers who investigate innate immune responses, host-pathogen interactions, chronic inflammatory disorders, cell and vascular biology, biochemistry, and autoimmunity. As we approach the 10-year-anniversary of the initial discovery of NETosis, it is useful and timely to review the so far identified mechanisms and pathways of NET formation, their role in bacterial and fungal defense and their putative importance as inducers of autoimmune responses. We look forward to a rich and rigorous discussion of these and related issues that benefit from interdisciplinary approaches, collaborations and exciting discoveries.
