## **EWING BRIANA**

---

*Alternative Methods for Toxicity Testing* Harvard University Press Readers drawn to Rachel Carson's *Silent Spring*, Laurie Garrett's *The Coming Plague*, or Theo Colburn's *Our Stolen Future* will appreciate this work by Thomas Kerns as well. The growing epidemics of chemically induced illnesses from long-term, low-dose exposure to toxicants in both developed and developing nations are being studied by serious researchers. Questions are

being raised as to how societies will deal with these new problems. Kerns's book is the first to directly address the ethical dimension of managing environmental health and ubiquitous toxicants (such as solvents, pesticides, and artificial fragrances). The work includes recent medical literature on chronic health effects from exposure to toxicants and the social costs of these disorders; relevant historic and human rights documents; recommendations for public policy and legislation; and primary obstacles faced by public health advocates. College instructors and students, victims of chemical sensitivity disorders, public health workers, scientists, and policymakers who are interested in the challenge of these emerging epidemics will find Kerns's

text highly informative.

*Toxic Torts* DIANE Publishing

Take a random walk through your life and you'll find it is awash in industrial, often toxic, chemicals. Sip water from a plastic bottle and ingest bisphenol A. Prepare dinner in a non-stick frying pan or wear a layer of Gore-Tex only to be exposed to perfluorinated compounds. Hang curtains, clip your baby into a car seat, watch television—all are manufactured with brominated flame-retardants. Cosmetic ingredients, industrial chemicals, pesticides, and other compounds enter our bodies and remain briefly or permanently. Far too many suspected toxic hazards are unleashed every day that affect the development and function of our brain, immune system, reproductive organs, or hormones. But no public health law requires product testing of most chemical compounds before they enter the market. If products are deemed dangerous, toxicants must be forcibly reduced or removed—but only after harm has been done. In this scientifically rigorous legal analysis, Carl Cranor argues that just as pharmaceuticals and pesticides cannot be sold without pre-market testing, other chemical products should be subject to the same safety measures. Cranor shows, in terrifying detail, what risks we run, and that it is entirely possible to design a less dangerous commercial world.

Philosophy and the Empirical Houghton Mifflin Harcourt

Evaluates federal regulatory actions on environmental chemicals known to cause adverse reproductive and developmental outcomes. Identifies 30 environmental chemicals found to be of high concern because of the widespread acknowledgment of their reproductive and developmental consequences as toxicants.

Determines the extent to which these chemicals are regulated by the federal government. Assesses the degree to which these regulatory actions are based on reproductive and developmental toxicity. Evaluates whether the regulatory protection currently provided to the public against reproductive and developmental disease is sufficient.

Morality, Responsibility, and the University Macmillan

Historically, regulations governing chemical use have often focused on widely used chemicals and acute human health effects of exposure to them, as well as their potential to cause cancer and other adverse health effects. As scientific knowledge has expanded there has been an increased awareness of the mechanisms through which chemicals may exert harmful effects on human health, as well as their effects on other species and ecosystems. Identification of high-priority chemicals and other chemicals of concern has prompted a growing number of state and local governments, as well as major companies, to take steps beyond existing hazardous chemical federal legislation. Interest in approaches and policies that ensure that any new substances substituted for chemicals of concern are assessed as carefully and thoroughly as possible has also burgeoned. The overarching goal of these approaches is to avoid regrettable substitutions, which occur when a toxic chemical is replaced by another chemical that later proved unsuitable because of persistence, bioaccumulation, toxicity, or other concerns. Chemical alternative assessments are tools designed to facilitate consideration of these factors to assist stakeholders in identifying chemicals that may have the greatest likelihood of harm to human and ecological health, and to provide guidance on how the industry

may develop and adopt safer alternatives. A Framework to Guide Selection of Chemical Alternatives develops and demonstrates a decision framework for evaluating potentially safer substitute chemicals as primarily determined by human health and ecological risks. This new framework is informed by previous efforts by regulatory agencies, academic institutions, and others to develop alternative assessment frameworks that could be operationalized. In addition to hazard assessments, the framework incorporates steps for life-cycle thinking - which considers possible impacts of a chemical at all stages including production, use, and disposal - as well as steps for performance and economic assessments. The report also highlights how modern information sources such as computational modeling can supplement traditional toxicology data in the assessment process. This new framework allows the evaluation of the full range of benefits and shortcomings of substitutes, and examination of tradeoffs between these risks and factors such as product functionality, product efficacy, process safety, and resource use. Through case studies, this report demonstrates how different users in contrasting decision contexts with diverse priorities can apply the framework. This report will be an essential resource to the chemical industry, environmentalists, ecologists, and state and local governments.

**Hazardous Waste Compliance** Oxford University Press

This book examines how dominant interest groups manipulate the available science to support their positions.

**Regulating Toxic Substances** Cambridge University Press

The proliferation of chemical substances in commerce poses scientific and philosophical problems. The scientific challenge is

to develop data, methodologies, and techniques for identifying and assessing toxic substances before they cause harm to human beings and the environment. The philosophical problem is how much scientific information we should demand for this task consistent with other social goals we might have. In this book, Cranor utilizes material from ethics, philosophy of law, epidemiology, tort law, regulatory law, and risk assessment, to argue that the scientific evidential standards used in tort law and administrative law to control toxics ought to be evaluated with the purposes of the law in mind. Demanding too much for this purpose will slow the evaluation and lead to an excess of toxic substances left unidentified and unassessed, thus leaving the public at risk. Demanding too little may impose other costs. An appropriate balance between these social concerns must be found. Justice requires we use evidentiary standards more appropriate to the legal institutions in question and resist the temptation to demand the most intensive scientific evaluation of each substance subject to legal action.

Tragic Failures Environmental Ethics and Scien

An Economist Book of the Year Every minute of every day, our data is harvested and exploited... It is time to pull the plug on the surveillance economy. Governments and hundreds of corporations are spying on you, and everyone you know. They're not just selling your data. They're selling the power to influence you and decide for you. Even when you've explicitly asked them not to. Reclaiming privacy is the only way we can regain control of our lives and our societies. These governments and corporations have too much power, and their power stems from us--from our data. Privacy is as collective as it is personal, and it's

time to take back control. *Privacy Is Power* tells you how to do exactly that. It calls for the end of the data economy and proposes concrete measures to bring that end about, offering practical solutions, both for policymakers and ordinary citizens.

**Decision Making for Regulating Chemicals in the Environment** Temple University Press

Characteristics of the regulatory process. The statutory basis of regulation. Advocacy and the regulatory process. The decision-making process. The uses and limits of benefit-cost analysis. Information on hazards and costs. Information on benefits.

*Only One Chance* Copyright Law of the United States

This treatise on the legal assessment of risks regarding toxic chemicals addresses the standards of evidence in legal proceedings and the regulatory decisions covering these chemicals.

**Public Health Ethics** National Academies Press

Author note: Steven M. Cahn is Provost and Professor of Philosophy at the Graduate School of the City University of New York.

Oxford University Press

*Prudent Practices in the Laboratory*--the book that has served for decades as the standard for chemical laboratory safety practice--now features updates and new topics. This revised edition has an expanded chapter on chemical management and delves into new areas, such as nanotechnology, laboratory security, and emergency planning. Developed by experts from academia and industry, with specialties in such areas as chemical sciences, pollution prevention, and laboratory safety, *Prudent Practices in the Laboratory* provides guidance on planning procedures for the handling, storage, and disposal of chemicals. The book offers

prudent practices designed to promote safety and includes practical information on assessing hazards, managing chemicals, disposing of wastes, and more. *Prudent Practices in the Laboratory* will continue to serve as the leading source of chemical safety guidelines for people working with laboratory chemicals: research chemists, technicians, safety officers, educators, and students.

**Privacy is Power** MIT Press

Publisher Description

*Rescuing Science from Politics* Yale University Press

'Overall, this collection of case studies provides an outstanding starting point for understanding the ethics of chemistry. It is an extremely important contribution to the study of chemical ethics ... *Ethics of Chemistry* is a key resource for educators interested in integrating ethics instruction into their chemistry curricula ... an important foundation for equipping students with the moral judgement and analytical skills necessary to contend with the ethical issues they are likely to face in their professional lives.' *Nature Chemistry* ... the book offers a general introduction to many relevant topics concerning the values, responsibilities, and judgements in (and of) chemistry. The volume could be helpful for university students and teachers or even general readers interested in the ethics of chemistry.' [Read Full Review] José Ramón Bertomeu-Sánchez *Ambix* Although chemistry has been the target of numerous public moral debates for over a century, there is still no academic field of ethics of chemistry to develop an ethically balanced view of the discipline. And while ethics courses are increasingly demanded for science and engineering students in many countries, chemistry is still lagging

behind because of a lack of appropriate teaching material. This volume fills both gaps by establishing the scope of ethics of chemistry and providing a case-based approach to teaching, thereby also narrating a cultural history of chemistry. From poison gas in WWI to climate engineering of the future, this volume covers the most important historical cases of chemistry. It draws lessons from major disasters of the past, such as in Bhopal and Love Canal, or from thalidomide, Agent Orange, and DDT. It further introduces ethical arguments pro and con by discussing issues about bisphenol-A, polyvinyl chloride, and rare earth elements; as well as of contested chemical projects such as human enhancement, the creation of artificial life, and patents on human DNA. Moreover, it illustrates chemical engagements in preventing hazards, from the prediction of ozone depletion, to Green Chemistry, and research in recycling, industrial substance substitution, and clean-up. Students also learn about codes of conduct and chemical regulations. An international team of experts narrate the historical cases and analyse their ethical dimensions. All cases are suitable for undergraduate teaching, either in classes of ethics, history of chemistry, or in chemistry classes proper.

#### A Framework to Guide Selection of Chemical Alternatives

##### Environmental Ethics and Science

One of every six children suffers from a neurodevelopmental abnormality of unknown cause. Environmental pollutants such as lead, mercury, and pesticides interfere with brain development, yet we do not test industrial chemicals for brain toxicity.

##### *Risk Regulation at Risk* McFarland

In the 1970s, the first wave of environmental regulation targeted

specific sources of pollutants. In the 1990s, concern is focused not on the ends of pipes or the tops of smokestacks but on sweeping regional and global issues. This landmark volume explores the new industrial ecology, an emerging framework for making environmental factors an integral part of economic and business decision making. Experts on this new frontier explore concepts and applications, including: Bringing international law up to par with many national laws to encourage industrial ecology principles. Integrating environmental costs into accounting systems. Understanding design for environment, industrial "metabolism," and sustainable development and how these concepts will affect the behavior of industrial and service firms. The volume looks at negative and positive aspects of technology and addresses treatment of waste as a raw material. This volume will be important to domestic and international policymakers, leaders in business and industry, environmental specialists, and engineers and designers.

##### *The Body Toxic* Cambridge University Press

Hazardous Waste Compliance concentrates on government regulations as they relate to hazardous waste and other hazardous materials. The main focus of this book is on how to comply with these requirements as well as on other best management practices (BMP), which will ensure worker safety and business protection from the risk of the commercial penalties associated with regulations breaches. The authors provide the reader with useful techniques to enhance worker protection and promote efficiency, productivity and cost effectiveness, along with achieving the necessary quality standards for the work being performed. The authors further outline and define methods to

help reduce worker injury and illness, the scope and application of HAZWOPER, and ways to implement hazardous material related requirements through enhancements of existing programs. In addition, detailed discussion helps to provide methods to help promote consistency in health and safety program development for handling hazardous materials, encourage a high standard for health and safety, and share lessons learned to help provide approaches that have been implemented on hazardous waste and other sites. Provides a comprehensive overview of regulatory requirements in the industry Real-life experiences are presented in the form of case histories A training aid for both new and experienced site workers  
**Silent Spring** Oxford University Press, USA

Discusses the reckless annihilation of fish and birds by the use of pesticides and warns of the possible genetic effects on humans.

**Risk and Reason** Elsevier

The Globally Harmonized System of Classification and Labelling of Chemicals (GHS) addresses classification and labelling of chemicals by types of hazards. It provides the basis for worldwide harmonization of rules and regulations on chemicals and aims at enhancing the protection of human health and the environment during their handling, transport and use by ensuring that the information about their physical, health and environmental hazards is available. The sixth revised edition includes, inter alia, a new hazard class for desensitized explosives and a new hazard category for pyrophoric gases; miscellaneous amendments intended to further clarify the criteria for some hazard classes (explosives, specific target organ toxicity following single exposure, aspiration hazard, and hazardous to the aquatic

environment) and to complement the information to be included in section 9 of the Safety Data Sheet; revised and further rationalized precautionary statements; and an example of labelling of a small packaging in Annex 7.

*Globally Harmonized System of Classification and Labelling of Chemicals (GHS)*. Harvard University Press

US tort law, cloaked behind increased judicial review of science, is changing before our eyes yet we cannot see it. While Supreme Court decisions have altered how courts review scientific testimony, the complexity of both science and legal procedures mask the resulting social consequences. Yet these consequences are too important to remain hidden. Mistaken court reviews of scientific evidence can decrease citizen access to the law, decrease incentives for firms to test their products, lower deterrence for harmful products, and decrease the possibility of justice for citizens injured by toxic substances. Even if courts review evidence well, increases in litigation costs and attorney screening of clients can impede access to the law. Newly revised and expanded, *Toxic Torts*, 2nd edition introduces these issues, reveals the relationships that can deny citizens just restitution for harms suffered, and shows how justice can be improved in toxic tort cases.

*Banned* National Academies

The purpose of this regional workshop in the Southeast was to broaden the environmental health perspective from its typical focus on environmental toxicology to a view that included the impact of the natural, built, and social environments on human health. Early in the planning, Roundtable members realized that the process of engaging speakers and developing an agenda for

the workshop would be nearly as instructive as the workshop itself. In their efforts to encourage a wide scope of participation, Roundtable members sought input from individuals from a broad range of diverse fields-urban planners, transportation engineers, landscape architects, developers, clergy, local elected officials, heads of industry, and others. This workshop summary captures the discussions that occurred during the two-day meeting. During this workshop, four main themes were explored: (1) environmental and individual health are intrinsically intertwined;

(2) traditional methods of ensuring environmental health protection, such as regulations, should be balanced by more cooperative approaches to problem solving; (3) environmental health efforts should be holistic and interdisciplinary; and (4) technological advances, along with coordinated action across educational, business, social, and political spheres, offer great hope for protecting environmental health. This workshop report is an informational document that provides a summary of the regional meeting.
