America's health care system has
become too complex and costly to
continue business as usual. Best Care at
Lower Cost explains that inefficiencies,
an overwhelming amount of data, and
other economic and quality barriers
hinder progress in improving health and
threaten the nation's economic stability
and global competitiveness. According to

this report, the knowledge and tools
exist to put the health system on the
right course to achieve continuous
improvement and better quality care at
a lower cost. The costs of the system's
current inefficiency underscore the
urgent need for a systemwide
transformation. About 30 percent of
health spending in 2009-roughly \$750
billion-was wasted on unnecessary
services, excessive administrative costs,
fraud, and other problems. Moreover,
inefficiencies cause needless suffering.
By one estimate, roughly 75,000 deaths
might have been averted in 2005 if
every state had delivered care at the
quality level of the best performing
state. This report states that the way
health care providers currently train,
practice, and learn new information

cannot keep pace with the flood of research discoveries and technological advances. About 75 million Americans have more than one chronic condition, requiring coordination among multiple specialists and therapies, which can increase the potential for miscommunication, misdiagnosis, potentially conflicting interventions, and dangerous drug interactions. Best Care at Lower Cost emphasizes that a better use of data is a critical element of a continuously improving health system, such as mobile technologies and electronic health records that offer significant potential to capture and share health data better. In order for this to occur, the National Coordinator for Health Information Technology, IT developers, and standard-setting

organizations should ensure that these systems are robust and interoperable. Clinicians and care organizations should fully adopt these technologies, and patients should be encouraged to use tools, such as personal health information portals, to actively engage in their care. This book is a call to action that will guide health care providers; administrators; caregivers; policy makers; health professionals; federal, state, and local government agencies; private and public health organizations; and educational institutions.

This updated edition defines the productive period of time typical health

care capital assets have before they become obsolete. The introduction includes an overview of the importance of the capital planning process and helpful tips on managing capital projects once they are under way. This edition contains information on hundreds of items and includes new capital assets that reflect recent technological developments. It provides asset life span estimates in reference tables for the major equipment and capital asset investments found in hospitals and physician group practices. This book can save any health care organization immeasurable time and reduce the risk of reimbursement questions arising from the assigned life of a capital asset. *American Hospital Association Guide to the Health Care Field* Amer Hospital Assn

The goal of eliminating disparities in health care in the United States remains elusive. Even as quality improves on specific measures, disparities often persist. Addressing these disparities must begin with the fundamental step of bringing the nature of the disparities and the groups at risk for those disparities to light by collecting health care quality information stratified by race, ethnicity and language data. Then attention can be focused on where interventions might be best applied, and on planning and evaluating those efforts to inform the development of policy and the application of resources. A lack of standardization of categories for race, ethnicity, and language data has been suggested as one obstacle to achieving more widespread collection and

utilization of these data. Race, Ethnicity, and Language Data identifies current models for collecting and coding race, ethnicity, and language data; reviews challenges involved in obtaining these data, and makes recommendations for a nationally standardized approach for use in health care quality improvement.

The anthrax incidents following the 9/11 terrorist attacks put the spotlight on the nation's public health agencies, placing it under an unprecedented scrutiny that added new dimensions to the complex issues considered in this report. The

Future of the Public's Health in the 21st Century reaffirms the vision of Healthy People 2010, and outlines a systems approach to assuring the nation's health in practice, research, and policy. This approach focuses on joining the unique resources and perspectives of diverse sectors and entities and challenges these groups to work in a concerted, strategic way to promote and protect the public's health. Focusing on diverse partnerships as the framework for public health, the book discusses: The need for a shift from an individual to a population-based approach in practice, research, policy, and community engagement. The status of the governmental public health infrastructure and what needs to be improved, including its interface with the health care delivery system. The roles

nongovernment actors, such as academia, business, local communities and the media can play in creating a healthy nation. Providing an accessible analysis, this book will be important to public health policy-makers and practitioners, business and community leaders, health advocates, educators and journalists.

According to the US Census Bureau, the US population aged 65+ years is expected to nearly double over the next 30 years, from 43.1 million in 2012 to an estimated 83.7 million in 2050. These demographic advances, however extraordinary, have left our health systems behind as they struggle to reliably provide evidence-based practice to every older adult at every care interaction. Age-Friendly Health Systems is an initiative of The John A. Hartford Foundation and the Institute for Healthcare Improvement (IHI), in partnership with the American Hospital

Association (AHA) and the Catholic Health Association of the United States (CHA), designed Age-Friendly Health Systems to meet this challenge head on. Age-Friendly Health Systems aim to:

Follow an essential set of evidence-based practices; Cause no harm; and Align with What Matters to the older adult and their family caregivers.
