Autosomal Dominant Polycystic Kidney Disease (ADPKD) is a highly prevalent hereditary renal disorder in which fluid-filled cysts are appeared in both kidneys. Main causative genes of ADPKD are PKD1 and PKD2, encoding for polycystin-1 (PC1) and polycystin-2 (PC2) respectively. Those proteins are localized on primary cilia and function as mechanosensor in response to the fluid flow, translating mechanistic stimuli into calcium signaling. With mutations either of PKD1 or PKD2, hyper-activated renal tubular epithelial cell proliferation is observed, followed by disrupted calcium homeostasis and aberrant intracellular cyclic AMP (cAMP) accumulation. Increased cell proliferation with fluid secretion leads to the development of thousands of epithelial-lined, fluid-filled cysts in kidneys. It is also accompanied by interstitial inflammation, fibrosis, and finally reaching end-stage renal disease (ESRD). In human ADPKD, the age at which renal failure typically occurs is later in life, however no specific targeted medications are available to cure ADPKD. Recently, potential therapeutic targets or surrogate diagnostic biomarkers

for ADPKD are proposed with the advances in the understanding of ADPKD pathogenesis, and some of them were attempted for clinical trials. Herein, we will summarize genetic and epi-genetic molecular mechanisms in ADPKD progression, and overview the currently available biomarkers or potential therapeutic reagents suggested.

Liver Disorders Atria

This book focuses on the critical care of the patient with acute, acute on chronic and chronic liver failure as well as the peri-operative care of the patient with liver transplantation. Each of these disease processes is unique in pathophysiological manifestations, underpinnings of physiology and treatment options. Patients with acute, chronic or acute on chronic liver failure are a growing fraction of ICU admissions. Hepatic Critical Care serves as the essential reference for both practicing intensivists at community hospitals and tertiary referral centers. This textbook is also targeted towards trainees specifically interested in taking care of patients with liver disease and liver transplantation.

Cystogenesis Infobase Publishing

This book focuses on patients with end-stage liver disease (ESLD) who could possibly qualify for liver transplant. This patient cohort raises many problems: who should be treated and also, when is it too late for transplant? The authors are all dedicated experts in the field of ESLD/liver transplantation, but from different disciplines with different views of the problem. In the past 15 years many things have changed in the treatment for these patients: cardiac assessment, treatment of porto-pulmonary hypertension, hemodynamics, coagulation assessment and management, diagnosis of kidney failure, and the timing of dialysis. These issues are comprehensively discussed in this book, in order to provide physicians starting in the field of transplantation an overview of different areas of concern. This
