The Fallopian tube has until recently been a neglected structure, bypassed by IVF and seen only as a tube that transports the egg to the uterus. More recently, its central role as the site of fertilization and early embryogenesis has been recognized, along with the major effects of tubal disease, such as chlamydia trachomatis, on fertility. Tubal surgery is an option for those women who avoid IVF because of anxiety about medication side-effects or for religious reasons. The tube is also the site for female sterilization and its reversal. This definitive guide to the Fallopian tube and its disorders collates all these topics, with authoritative text covering the spectrum of clinically relevant topics in a digestible fashion. It will be of interest to gynecologists, specialists in reproductive medicine and infertility and family planning, and others with interest in this fascinating and underestimated organ of reproduction. *Human Reproductive Biology* Springer

The male reproductive system consists of the hypothalamic-pituitary unit, the testes, the reproductive tract, and the external genitalia. The functions of the male reproductive system are to produce and deliver spermatozoa, for sexual reproduction, and produce hormones that regulate reproductive function and secondary sex characteristics. Abnormalities in anatomic or physiologic function affect the development and delivery of spermatozoa, and potential fertility. Male factors are often the cause of a couple's failure to conceive, therefore, it is important to evaluate and treat the male partner. A male factor may be due to abnormalities of hormonal control, testicular function, or sperm transport or delivery. This book provides a

comprehensive review of the clinical anatomy and physiology specific to male reproductive system, emphasizing causes and management of male infertility. By developing a clear understanding of what is normal, you will better understand abnormalities affecting male fertility and the mechanisms behind treatment. *Ovarian Cycle* Cambridge University Press The response to the First Edition of this text confirmed our belief that there was a need for a book of this kind. The multi-authored approach has been retained, ensuring that authoritative, current information is incorporated into each chapter and that references are up-to-date. The section on diseases of the vagina has been enhanced by a greater emphasis on the clinical aspects. The chapter on DES induced lesions has been updated with the data of the DeSAD study and the section on adenocarcinoma of the cervix has been enlarged by the description of the undifferentiated lesions including "glassy cell and signet cell" carcinoma. A departure from the traditional chapter approach has been made in the discussion of endometrial hyperplasia and carcinoma in order to present a conceptual view of these diseases. A similar presentation of diseases of the myometrium has been made. The subjects of lymphomas and mesenchymal tumors of the ovary have been enlarged upon and presented in a separate chapter. Fine needle aspiration in the diagnosis of ovarian tumors and of non-malignant disorders of the ovary has become an increasingly useful technique. Two new chapters have been added to cover this subject. Many of the changes made in the second edition were in response to reviewers of the First Edition. It is hoped that their constructive suggestions have been addressed. Ancel Blaustein, M.D.

The International Life Sciences Institute (ILSI) was established to stimulate and support scientific research and educational programs in nutrition, toxicology, and food safety; and to encourage cooperation in these programs among scientists from universities, industry, and government in order to facilitate the resolution of health and safety issues. The officers and trustees of ILSI believe that questions regarding health and safety are best resolved when government and industry rely on scientific investigations, analyses, and reviews by independent experts. This process is furthered by the examination and discussion of issues on

an international basis. ILSI is pleased to sponsor this set of monographs on the pathology of laboratory animals. This project collectively brings together the most comprehensive information on non-neoplastic and neoplastic lesions that occur in commonly used laboratory animals. The international composition of the authors, editors, and editorial board who have contributed to these monographs strengthens our expectations that understanding and cooperation will be strengthened worldwide through this series.

This colposcopy manual was developed in the context of the cervical cancer screening research studies of the International Agency for Research on Cancer (IARC) and the related technical support provided to national programs. It is thus a highly comprehensive manual, both for the training of new colposcopists and for the continuing education and reorientation of those who are more experienced. This manual offers a valuable learning resource, incorporating recent developments in the understanding of the etiology and pathogenesis of cervical intraepithelial neoplasia (CIN), as well as in colposcopy and cervical pathology. Expertise in performing satisfactory, safe,

and accurate colposcopic examinations requires high competence in the technical, interpretive, and cognitive aspects, and the capability to develop pragmatic and effective management plans and treatment. This comprehensive and concise manual covers all these aspects and serves as a useful handbook for acquiring the necessary skills for the visual recognition and interpretation of colposcopic findings and for developing the personal and professional attributes required for competence in colposcopy.
