This book provides the reader with the best available evidence on the most pressing issues relating to reconstruction of the anterior cruciate ligament (ACL) with the goal of supporting surgical reconstruction of the ACL and improving outcomes for patients. Key topics for which evidence-based information is presented include selection of graft material and source, the use of different surgical techniques, graft rupture in relation to surgical technique, and progression to osteoarthritis. The book will aid the surgeon in making decisions with respect to fixation devices and tensioning, the bundles to be reconstructed, and whether to preserve remnants or partial bundle ruptures. An evidence-based stance is taken on evolving topics such as the anatomy of the tibial insertion site of the ACL and the role of the anterolateral capsule and posteromedial corner in high-grade rotatory instability. Furthermore, novel technical developments for measurement of knee laxity and soft tissue navigation are

discussed. The reader will also find useful information on general issues concerning physical examination, arthroscopic setup, timing of reconstruction, anesthesia, and anticoagulation.

The popularity of NXT and the success of The Da Vinci Code book and movie are combined in this fascinating book. Projects for building and programming five of Leonardo's most famous inventions are covered in detail: the Tank, the Helicopter, the Catapult, the Flying Machine, and the Revolving Bridge. This book is written for serious NXT programmers and covers the most popular programming environments available today. The book is abundantly illustrated and includes sample code and countless best practices strategies. Advanced NXT: The Da Vinci Inventions Book complements Apress successful line of Mindstorms books by providing advanced programming techniques in a rich historical context.

This book summarizes the experience gained by the Orthopedic Study Group for the Knee (OAK) of the Swiss Orthopedic Society in dealing with knee problems relating to deficiencies of the

cruciate ligaments. The editors, R.P. Jakob and H.-U. Staubli, have collaborated with international authorities to produce this excellent work dealing with a great many aspects of knee surgery and especially the problems of the cruciate ligaments. For clarity, the book begins with definitions and explanations of basic biomechanical terms. The chapters on Anatomy and Biomechanics present up-to-date scientific information based on anatomic and biomechanical principles as they are applied in modern knee surgery. The second part of the book focuses on the OAK-sanctioned approach to knee documentation and evaluation, which is a valuable supplement to other knee evaluation schemes. The European Society for Knee Surgery (ESKA) and the American Orthopedic Society for Sports Medicine (AOSSM) are currently attempting to combine the advantages of the OAK system with an internationally valid evaluation scheme to create a standard evaluation and documentation system that will be acceptable to all physicians.

This book presents the essential anatomic and radiological data, discussing new and refined techniques of imaging such that readers may rely on their interpretation. The chapters on pathology are approached in a clinical context, accompanied by numerous diagrams and photographs, while the references, both classical and recent, are profuse. The result is a complete review of the subject, of interest to both the specialist and the non-specialist.

Since the introduction of laser technology into medicine, quite a number of clinical applications in orthopaedics have been developed. This text is the first to provide comprehensive guidelines and how-to-do instructions for the application of lasers in orthopaedics. These cover patient selection and decision-making as well as the benefits and risks of the clinical application of lasers in arthroscopic surgery, spine surgery and open surgery. An overview is given on the basics of laser technology and the various laser types are evaluated in terms of optimal use.

Hip resurfacing arthroplasty (HRA) using metal-on-metal bearings is an established but specialised technique in joint surgery. Based on the experience of leading experts in the field, The hip resurfacing handbook provides a comprehensive reference for all aspects of this important procedure. The first part of the book reviews and compares all the major hip resurfacing prostheses, their key design features, relevant surgical techniques and clinical results. Part two discusses clinical follow-up of the hip resurfacing patient, including pre- and post-operative examination, acoustic phenomena and rehabilitation. It also covers the use of techniques such as radiography and metal ion measurement, as well as bone scans, ultrasound, CT, MRI, PET and DEXA, to evaluate hip resurfacings. Part three reviews best practice in surgical technique, including the modified posterior and anterior approaches, as well as instrumentation, anaesthesia and revision surgery. Based on extensive retrieval studies, Part four includes examples of the main failure modes in HRA. The final part of the book includes patients' own experiences, a comparison of HRA with total hip arthroplasty (THA), regulatory issues and relevant web sites. Comprehensive in its scope and authoritative in its coverage, The hip resurfacing handbook is a standard work for orthopaedic surgeons and all those involved in HRA. A standard work for orthopaedic surgeons and all those involved in HRA Reviews and compares all the major hip resurfacing prostheses, their key design features, relevant

Trauma and Mental Health in the Wake of a Technological Disaster Springer

A gas explosion in Ghislenghien (Belgium, July 2004) instantly killed five firefighters, one police officer and 18 civilians.

Moreover, 132 people were wounded and many of them suffered severe burn injuries. This book aims at clarifying the impact of a technological disaster, both phenomenologically and empirically. It also wishes to enhance the understanding of the challenges for psychological help in the wake of technological disaster. On the phenomenological side, the experiences of a disaster survivor are used to set the stage for a discussion on the conceptual differences between mainstream (Anglo-Saxon) trauma theories and the more classical (French) psychodynamic theories. Three chapters provide contextual information on the trauma inflicted by a massive explosion. On the empirical side, the focus is on the prevalence of posttraumatic stress symptoms in adult and child survivors of a massive gas explosion, in their family members as well as in family members of deceased victims. Four chapters provide a quantitative approach of trauma-related mental health disturbances in adults and children after a technological disaster. The results clearly indicate the influence of the degree of exposure, peritraumatic dissociation and dissatisfaction with social support on the development of posttraumatic stress symptoms. The risk for the development of four types of mental health disturbances (somatization, depression, anxiety and sleeping disturbances) was much higher in direct witnesses who have seen human damage. The epilogue discusses possible future developments for early psychophysiological stabilization of disaster victims.

With the constant evolution of implant technology, and improvement in the production of allograft and bone substitutes, the armamentarium of the orthopaedic surgeon has significantly expanded. In particular, the recent involvement of nanotechnologies opens up the possibilities of new approaches in the interactive interfaces of implants. With many important developments occurring since the first edition of this well-received book, this updated resource informs orthopaedic practitioners on a wide range of biomechanical advances in one complete reference guide. Biomechanics and Biomaterials in Orthopedics, 2nd edition compiles the most prominent work in the discipline to offer newly-qualified orthopedic surgeons a summary of the fundamental skills that they will need to apply in their day-to-day work, while also updating the knowledge of experienced surgeons. This book covers both basic concepts

concerning biomaterials and biomechanics as well as their clinical application and the experience from everyday practical use. This book will be of great value to specialists in orthopedics and traumatology, while also providing an important basis for graduate and postgraduate learning.

Written by the world's leading shoulder surgeons, this volume offers much-needed guidance on managing complex and revision problems that cannot be solved by standard treatment formulas. The authors present successful approaches with illustrative case examples, emphasizing avoidance of common pitfalls and management of complications. This edition has a greater focus on arthroscopic procedures and includes full-color arthroscopic images. New chapters cover arthroscopic rotator cuff reconstruction, idiopathic and diabetic stiff shoulder, alternatives to arthroplasty, and the failed arthroplasty. The thoroughly revised fractures section includes new information on two-, three-, and four-part fractures and AC/SC fractures. This edition contains over 800 illustrations.

Controversies in the Technical Aspects of ACL Reconstruction

Divided into two parts, this book discusses various aspects of bone SPECT/CT of ankle and foot. The first part is dedicated to foot and ankle pathology and concisely presents those disorders most frequently detected with a bone scan. The authors also describe common pathologies that cannot be diagnosed with bone scans, such as Morton's neuroma, but which nuclear physicians need to recognize. Orthopedic surgeons' expectancies are highlighted and several bone scan studies of clinical interest are presented. The second part is devoted to anatomy: bones, articulations and all relevant anatomical structures that are necessary to interpret a bone scan of the ankle and foot are described by means of anatomical illustrations with captions. At the end of the last decade, hybrid scanners with the ability to acquire single-photon emission computed tomoscintigraphy (SPECT) and multislice CT data simultaneously were introduced, thus opening a wide range of perspectives for nuclear physicians. Like their radiologist colleagues in the early 1990s, nuclear physicians have discovered pathologies that they were unaware of and have visualized increased tracer uptakes that they were previously unable to detect. This book, written by nuclear physicians and orthopedic surgeons specialized in the foot and ankle, will increase understanding of this whole new semiology. The internationally recognized Terminologia Anatomica has been used for the nomenclature of anatomical structures.
