Case Studies in Immunology Lippincott Williams & Wilkins

This edition of the Manual of Neonatal Care has been completely updated and extensively revised to reflect the changes in fetal, perinatal, and neonatal care that have occurred since the sixth edition. This portable text covers current and practical approaches to evaluation and management of conditions encountered in the fetus and the newborn, as practiced in high volume clinical services that include contemporary prenatal and postnatal care of infants with routine, as well as complex medical and surgical problems. Written by expert authors from the Harvard Program in Neonatology and other major neonatology programs across the United States, the manual's outline format gives readers rapid access to large amounts of valuable information quickly. The Children's Hospital Boston Neonatology Program at Harvard has grown to include 57 attending neonatologists and 18 fellows who care for more than 28,000 newborns delivered annually. The book also includes the popular appendices on topics such as common NICU medication guidelines, the effects of

maternal drugs on the fetus, and the use of maternal medications during lactation. Plus, there are intubation/sedation guidelines and a guide to neonatal resuscitation on the inside covers that provide crucial information in a quick and easy format.

Prescribing for children is a particularly challenging discipline due to specific issues of drug absorption, metabolism, distribution and excretion. The aim of this book is to improve understanding in all aspects of paediatric prescribing, from the development of suitable drugs through to their practical administration. With its origins in the EU-funded Global Research in Paediatrics (GRiP) project this is the first truly international textbook to provide guidance on the principles behind optimal neonatal and paediatric prescribing. Harnessing the international expertise of paediatricians and pharmacists in the field, Prescribing Medicines for Children compliments the British National Formulary for Children (BNFC), facilitating translation of essential pharmacological principles into good prescribing practice. It incorporates specific information on how to promote safe and effective prescribing in paediatrics, including how to avoid medication errors and adverse drug reactions in children. Highlights include the differences in prescribing habits between countries and the shared principles that underpin rational prescribing in paediatrics and neonatology. The book is divided into two sections: Section A provides concise educational material relating to paediatric pharmacology and optimising how medicines are

developed and prescribed for children. Section B considers key clinical prescribing areas and can be used as a quick reference guide. Each chapter is focused on the key issues in prescribing for a respective clinical specialty or context. Prescribing Medicines for Children is essential reading for all those who are involved in prescribing medicines to neonates and children. This includes undergraduate and postgraduate pharmacists, nurses, paediatricians and primary care physicians, academic scientists, and those working in the pharmaceutical industry and drug regulation.

Perinatal cardiology is an important developing field as high quality ultrasound is used on a growing number of pregnant women, and diagnosis prior to birth will become a more common occurrence. In addition, highly sensitive noninvasive diagnostic tools, advances in neonatal care and anesthesia, evolution of transcatheter interventional procedures and performance of complicated surgical procedures in the neonate and young infant have advanced to such an extent that almost all congenital cardiac defects can be diagnosed and "corrected." Illustrated with over 500 figures, this book by leaders in the fields of pediatric cardiology, neonatology, pediatric cardiovascular surgery and interventional pediatric cardiology focuses on congenital heart defect issues during the perinatal period: prenatal (before birth) and neonatal (first month after birth). This book discusses the three major areas of perinatal cardiology: Provides an overview of advances in perinatology, neonatology, cardiology and cardiac surgery in making early diagnosis and offering treatment options for patients with CHD. The concept of the multidisciplinary approach to managing infants with congenital cardiac lesion. Evidence-based therapeutic approaches to successfully treat the fetus and the newborn with congenital cardiac lesions. Audience: Pediatric cardiologists, cardiologists, neonatologists, maternal-fetal specialists, pediatric intensivists, cardiovascular surgeons, and house-staff in pediatric cardiology and neonatal and pediatric intensive care units. Dr. Rao's vision of the direction of pediatric cardiology has led to his acceptance that a great part of serious congenital heart disease is now managed in the perinatal period... This book is written not only for the pediatric cardiologist but for all those specialists and subspecialists who participate in a programmatic approach to the child with congenital heart disease, from the embryologist to the pediatrician or family practitioner to the hands of caregivers in the tertiary care setting. - From the Foreword by William B. Strong, MD
