System Anatomy of the
Urinary System. The
urinary system consists of
two kidneys, two ureters,
a urinary bladder, and a

urethra. The kidneys
alone perform the
functions just described
and manufacture urine in
the process, while the
other organs of the
urinary system provide
temporary storage
reservoirs for urine or
serve as transportation
channels to carry it from
one body region to
another. Urinary System

the Urinary System | Johns
Hopkins Medicine The
urinary system consists of
the kidneys, ureters,
bladder, and the urethra.
The kidney consists of
millions of functional units
called nephrons. The
urinary system removes
wastes from the body and
regulates blood volume
and blood pressure. It also
controls the levels of

electrolytes and metabolites in body fluids and regulates blood pH. Urinary System - Anatomy & Physiology Anatomy and Physiology - The Urinary System Humans have the capacity to excrete toxins. For instance, the urinary system is major excretory system of the body. It helps in homeostasis specifically in electrolyte balance, fluid balance and acid-base balance. Urinary System Anatomy And Physiology - RNspeak.com The urinary system consists of the kidneys, ureters, urinary bladder, and urethra. The kidneys filter the blood to remove wastes and produce urine. The ureters, urinary bladder, and urethra together form the urinary tract, which acts as a plumbing system to drain urine from the kidneys, store it, and then release it during urination. Urinary System: Anatomy and Physiology with Interactive ... The renal system, which is also called the urinary system, is a group of organs in the body that filters out excess fluid and other substances from the bloodstream. The purpose of the renal system is to eliminate wastes from the body, regulate blood volume and pressure,

control levels of electrolytes and metabolites, and regulate blood pH. Overview of the Urinary System | Boundless Anatomy and ... The Urinary System is a group of organs in the body concerned with filtering out excess fluid and other substances from the bloodstream. The substances are filtered out from the body in the form of urine. Urine is a liquid produced by the kidneys, collected in the bladder and excreted through the urethra. Human Physiology/The Urinary System The urinary system, also known as the renal system or urinary tract, consists of the kidneys, ureters, bladder, and the urethra. The purpose of the urinary system is to eliminate waste from the body, regulate blood volume and blood pressure, control levels of electrolytes and metabolites, and regulate blood pH.
