A new 2024 translation of Martin Heidegger's major work "Being and Time" (Sein und Zeit), originally published in 1927 in multiple publications. This edition contains a new afterword by the Translator, a timeline of Heidegger's life and works, a philosophic index of core Heideggerian concepts and a guide for terminology across 19th and 20th century Existentialists. This translation is designed for readability and accessibility to Heidegger's enigmatic and dense philosophy. Complex and specific philosophic terms are translated as literally as possible and academic footnotes have been removed to ensure easy reading. Being and Time presents a complex philosophical discourse on the nature of being (Sein) and time (Zeit), focusing in particular on the temporal-existentialist concept of Dasein, a term that combines the German words for "to be" (sein) and "there" (da). This classic philosophic work examines the traditional metaphysical understanding of being, arguing that this understanding, typically based on the idea of a constant presence, fails to account for the temporal and existential dimensions of being. Heidegger proposes that an understanding of being requires an analysis of Dasein, which is characterized not only by its existence, but also by its being in the world and its temporal existence. The concept of Dasein is central to the his argument, emphasizing that Dasein is always already situated in a world, and its understanding of being is shaped by its temporal existence. This perspective challenges traditional metaphysical notions of being as static and unchanging, proposing instead that being is fundamentally temporal and connected to human existence and understanding. As the title suggests, Heidegger sees the question of Being as indistinguishable from Time, arguing that Newtonian conceptions of time as a series of now-points are inadequate for understanding the being of Dasein. His Ontochronology argues that the existential and ontological analysis of Dasein reveals a more fundamental concept of time, one that is integral to the structure of Being itself. The text further elaborates on the idea of "thrownness" and several other existentialist themes. Thrownness is one of the three conditions that signifies Dasein's immersion in the world, where it finds itself already entangled in a web of relations and meanings. This "thrownness", combined with Dasein's inherent being-toward-death, underscores the existential condition of human beings, framing their existence as a continual engagement with their own finitude and the possibilities of their being. Heidegger posits that understanding the nature of being requires a fundamental rethinking of both being and time, dogmatically stating that the true nature of being can only be grasped through an understanding of the temporality that characterizes the existence of being.

A thought-provoking argument that consciousness—more widespread than previously assumed—is the feeling of being alive, not a type of computation or a clever hack In *The Feeling of Life Itself*, Christof Koch offers a straightforward definition of consciousness as any subjective experience, from the most mundane to the most exalted—the feeling of being alive. Psychologists study which cognitive operations underpin a given conscious perception. Neuroscientists track the neural correlates of consciousness in the brain, the organ of the mind. But why the brain and not, say, the liver? How can the brain—three pounds of highly excitable matter, a piece of furniture in the universe, subject to the same laws of physics as any other piece—give rise to subjective experience? Koch argues that what is needed to answer these questions is a quantitative theory that starts with experience and proceeds to the brain. In *The Feeling of Life Itself*, Koch outlines such a theory, based on integrated information. Koch describes how the theory explains many facts about the neurology of consciousness and how it has been used to build a clinically useful consciousness meter. The theory predicts that many, and perhaps all, animals experience the sights and sounds of life; consciousness is much more widespread than conventionally assumed. Contrary to received wisdom, however, Koch argues that programmable computers will not have consciousness. Even a perfect software model of the brain is not conscious. Its simulation is fake consciousness. Consciousness is not a special type of computation—it is not a clever hack. Consciousness is about being.

New York Times bestseller • *Life on the Edge* alters our understanding of our world's fundamental dynamics through the use of quantum mechanics. Life is the most extraordinary phenomenon in the known universe; but how did it come to be? Even in an age of cloning and artificial biology, the remarkable truth remains: nobody has ever made anything living entirely out of dead material. Life remains the only way to make life. Are we still missing a vital ingredient in its creation? Using first-hand experience at the cutting edge of science, Jim Al-Khalili and Johnjoe Macfadden reveal that missing ingredient to be quantum mechanics. Drawing on recent ground-breaking experiments around the world, each chapter in *Life on the Edge* illustrates one of life's puzzles: How do migrating

birds know where to go? How do we really smell the scent of a rose? How do our genes copy themselves with such precision? *Life on the Edge* accessibly reveals how quantum mechanics can answer these probing questions of the universe. Guiding the reader through the rapidly unfolding discoveries of the last few years, Al-Khalili and McFadden describe the explosive new field of quantum biology and its potentially revolutionary applications, while offering insights into the biggest puzzle of all: what is life? As they brilliantly demonstrate in these groundbreaking pages, life exists on the quantum edge. Winner, Stephen Hawking Medal for Science Communication

Christian is a phenomenon on the athletic field and in the classroom, but a terrifying accident on a fishing trip with his grandfather changes his life forever. The Pearson family moved from the city to the sleepy town of Red Oak, Iowa, before his freshman year of high school. Christian hoped for a smooth transition to small town life, but he hides a secret that he plans to take to his grave. Being the new kid in school has been a blessing and a curse. Most of the boys in Christian's class view him as a threat, so Christian struggles to fit in. But as an outcast, his secret is safe. When three freshmen, all from the same family, start school a week late, Christian senses something different about these new students. He reaches out to "The Three" seeking some semblance of friendship in his new hometown. When "The Three" confront Christian about the secret he hides, Christian is faced with a huge problem. Will his secret cost Christian his friends, his family, his freedom, and even his life?

The Phenomenon of Anne Frank Penguin

In Book One of this four-volume work, Alexander describes a scientific view of the world in which all space-matter has perceptible degrees of life, and establishes this understanding of living structures as an intellectual basis for a new architecture. He identifies fifteen geometric properties which tend to accompany the presence of life in nature, and also in the buildings and cities we make. These properties are seen over and over in nature and in the cities and streets of the past, but they have almost disappeared in the impersonal developments and buildings of the last hundred years. This book shows that living structures depend on features which make a close connection with the human self, and that only living structure has the capacity to support human well-being.

The case history approach has an impressive record of success in a variety of disciplines. Collections of case histories, casebooks, are now widely used in all sorts of specialties other than in their familiar application to law and medicine. The case method had its formal beginning at Harvard in 1871 when Christopher Lagdell developed it as a means of teaching. It was so successful in teaching law that it was soon adopted in medical education, and the collection of cases provided the raw material for research on various diseases. Subsequently, the case history approach spread to such varied fields as business, psychology, management, and economics, and there are over 100 books in print that use this approach. The idea for a series of Casehooks in Earth Science grew from my experience in organizing and editing a collection of examples of one variety of sedimentary deposits. The project began as an effort to bring some order to a large number of descriptions of these deposits that were so varied in presentation and terminology that even specialists found them difficult to compare and analyze. Thus, from the beginning, it was evident that something more than

a simple collection of papers was needed. Accordingly, the nearly fifty contributors worked together with George de Vries Klein and me to establish a standard format for presenting the case histories.

The Courage to Be Disliked Simon and Schuster

"Full of fascinating insights drawn from an impressive range of disciplines, *The Ascent of Information* casts the familiar and the foreign in a dramatic new light." —Brian Greene, author of *The Elegant Universe* Your information has a life of its own, and it's using you to get what it wants. One of the most peculiar and possibly unique features of humans is the vast amount of information we carry outside our biological selves. But in our rush to build the infrastructure for the 20 quintillion bits we create every day, we've failed to ask exactly why we're expending ever-increasing amounts of energy, resources, and human effort to maintain all this data. Drawing on deep ideas and frontier thinking in evolutionary biology, computer science, information theory, and astrobiology, Caleb Scharf argues that information is, in a very real sense, alive. All the data we create—all of our emails, tweets, selfies, A.I.-generated text and funny cat videos—amounts to an aggregate lifeform. It has goals and needs. It can control our behavior and influence our well-being. And it's an organism that has evolved right alongside us. This symbiotic relationship with information offers a startling new lens for looking at the world. Data isn't just something we produce; it's the reason we exist. This powerful idea has the potential to upend the way we think about our technology, our role as humans, and the fundamental nature of life. *The Ascent of Information* offers a humbling vision of a universe built of and for information. Scharf explores how our relationship with data will affect our ongoing evolution as a species. Understanding this relationship will be crucial to preventing our data from becoming more of a burden than an asset, and to preserving the possibility of a human future.

A Constellation of Vital Phenomena Taylor Trade Publications

Conscience: Phenomena and Theories was first published in German in 1925 as a dissertation by Hendrik G. Stoker under the title *Das Gewissen: Erscheinungsformen und Theorien*. It was received with acclaim by philosophers at the time, including Stoker's dissertation mentor Max Scheler, Martin Heidegger, and Herbert Spiegelberg, as quite possibly the single most comprehensive philosophical treatment of conscience and as a major contribution in the phenomenological tradition. Stoker's study offers a detailed historical survey of the concept of conscience from ancient times through the Middle Ages up to more modern thinkers, including Schopenhauer, Nietzsche, Freud, and Cardinal Newman. Stoker analyzes not only the concept of conscience in academic theory but also various types of theories of conscience. His work offers insightful discussions of problems and theories related to the genesis, reliability, and validity of conscience. In particular, Stoker analyzes the moral, spiritual, and psychological phenomena connected with bad conscience, which in turn illuminate the concept of conscience. The book is deeply informed by the traditions of western Christianity.

Available for the first time in an accessible English translation, with an introduction by its translator and editor, Philip E. Blosser, it promises to be of interest to philosophers, especially in Christian philosophy and phenomenology, and also to all those interested in moral and religious psychology, ethics, religion, and theology.

"What Is Life?" is Nobel laureate Erwin Schrödinger's exploration of the question which lies at the heart of biology. His essay, "Mind and Matter," investigates what place consciousness occupies in the evolution of life, and what part the state of development of the human mind plays in moral questions. "Autobiographical Sketches" offers a fascinating fragmentary account of his life as a background to his scientific writings.

Hans Jonas, a pupil of Heidegger and a colleague of Hannah Arendt at the New School for Social Research, was one of the most prominent phenomenologists of his generation. This carefully chosen anthology of Jonas's shorter writings - on topics from Jewish philosophy to philosophy of religion to philosophy of biology and social philosophy - reveals their range without obscuring their central unifying thread: that as living, biological beings, we are also beings who die, and who must consider the implications for current and future ethical and social relations.
