Encyklopädisches französisch-deutsches und deutsch-französisches Wörterbuch, enthaltend unter anderem für beide Sprachen Univ of California Press

"This spectacular book does full justice to the Compositae (Asteraceae), the largest and most successful flowering plant family with some 1700 genera and 24,000 species. It is an indispensable reference, providing the most up-to-date hypotheses of phylogenetic relationships in the family based on molecular and morphological characters, along with the corresponding subfamilial and tribal classification. The 2009 work not only integrates the extensive molecular phylogenetic analyses conducted in the last 25 years, but also uses these to produce a metatree for about 900 taxa of Compositae. The book contains 44 chapters, contributed by 80 authors, covering the history, economic importance, character variation, and systematic and phylogenetic diversity of the family. The emphasis of this work is phylogenetic; its chapters provide a detailed, current, and

thoroughly documented presentation of the major (and not so major) clades in the family, citing some 2632 references. Like the Compositae, the book is massive, diverse, and fascinating. It is beautifully illustrated, with 170 figures, and an additional 108 cladograms (all consistently color-coded, based on the geographic range of the included taxa); within these figures are displayed 443 color photographs, clearly demonstrating the amazing array of floral and vegetative form expressed by members of the clade." --NHBS Environment Bookstore.

He argues that the concept of family resemblances, as that concept has been refined and extended in prototype theory in the contemporary cognitive sciences, is the most plausible analytical strategy for resolving the central problem of the book. In the solution proposed, religion is conceptualized as an affair of "more or less" rather than a matter of "yes or no," and no sharp line is drawn between religion and non-religion."--BOOK JACKET.

Systematics, Evolution, and Biogeography of Compositae Elsevier Health Sciences

The Fourth Edition of The Light and Smith Manual continues a sixty-five-year tradition of providing to both students and professionals an indispensable, comprehensive, and authoritative guide to Pacific coast marine invertebrates of coastal waters, rocky shores, sandy beaches, tidal mud flats, salt marshes, and floats and docks. This classic and unparalleled reference has been newly expanded to include all common and many rare species from Point Conception, California, to the Columbia River, one of the most studied areas in the world for marine invertebrates. In addition, although focused on the central and northern California and Oregon coasts, this encyclopedic source is useful for anyone working in North American coastal ecosystems, from Alaska to Mexico. More than one hundred scholars have provided new keys, illustrations, and annotated species lists for over 3,500 species of intertidal and many shallow water marine organisms ranging from protozoans to sea squirts. This expanded volume covers sponges, sea anemones, hydroids, jellyfish, flatworms, polychaetes, amphipods, crabs, insects, snails, clams, chitons, and scores of other important groups. The Fourth Edition also features introductory chapters on marine habitats and biogeography, interstitial marine life, and intertidal parasites, as well as expanded treatments of common planktonic organisms likely to be encountered in near-to-shore shallow waters.

les Houches This Winter School on "The Physics and Fabrication of Microstructures" originated with a European industrial decision to investigate in some detail the potential of custom-designed microstructures for new devices. Beginning in 1985, GEC and THOMSON started a collaboration on these subjects, supported by an ESPRIT grant from the Commission of the European Community. To the outside observer of the whole field, it appears clear that the world effort is very largely based in the United States and Japan. It also appears that cooperation and dissemination of results are very well organised outside Europe and act as a major influence on the development of new concepts and devices. In Japan, a main research programme of the Research and Development for Basic Technology for Future Industries is focused on "Future Electron Devices". In Japan and in the United States, many workshops are organised annually in order to bring together the major specialists in industry and academia, allowing fast dissemination of advances and contacts for

setting up cooperative efforts.

Gray's Anatomy E-Book

Fjords are deep, glacially carved estuaries that are peculiar to certain coastlines, and have several characteristics that distinguish them from shallower embayments. At higher latitudes they indent the western coastlines of Scandinavia, North and South America, and New Zealand. They are also a common feature of much of the arctic coastline. The papers contained in this volume were presented at a workshop funded by the NATO Advanced Studies Institute in Victoria, British Columbia. It may seem curious to the reader that this special class of estuaries should have attracted an international gathering of oceanographers from several different disciplines. The reason for this interest stems from both practical and scientific considerations. On the one hand, fjords are a feature common to the coastlines of several countries that depend heavily on the oceans for communication, fisheries and other resources. The impact of man's activities on these coasts has created a demand for new knowledge of the physical, biological and chemical aspects of fjords. Sometimes man's influence on the ocean is intentional as, for example, in the artificial control of ice cover; often it is the more insidious build-up of toxic wastes that is of concern. These problems are particularly acute where the conflicting demands of fisheries, industrial development and recreation meet in a single fjord; and indeed, this is a common occurrence along several of the fjords in Scandinavia and Canada.
