A good image is more than just acceptable exposure and sharp focus -- two components that photography instruction concentrates on. A fascinating subject doesn't necessarily result in a good image, and likewise, it's possible to create an outstanding image of a mundane subject. So how do you know the difference? Perhaps you've read a lot of material on how to use your camera, how to manage images, and/or how to make adjustments using different software programs. What usually is not covered is what needs to be done beyond obvious exposure, noise, and sharpening issues so that you can intuitively recognize the difference between a good and bad image, and most importantly, why. That's where this book comes in. Rather than wasting time blindly trying one approach or another until something seems right, the quality of your imagery and the speed of your workflow will both vastly improve once you are able to articulate why you prefer one image to another. Expert authors Josh and Ellen Anon have spent years perfecting their visual-intensity based approach to composition, and in this gorgeous, full color guide, they'll share their techniques with you so that your overall photographic experience, both in terms of time investment and quality of

output, will become a much more satisfying one.

The focus of this book is surface modification, with the goal of tailoring materials for a specific application. By means of this approach, ideal bulk properties of a material, such as its tensile strength (temperature stability, density, or even cost) can be combined with optimized surface properties, such as hardness, biocompatibility, low or high friction or adhesion, water repellency or wettability, or catalytic activity. The works of the author — many of his crucial papers are included — deal with the understanding and modification of surfaces and span fields including catalysis, analytical surface science, self-assembled monolayers, tribology, biomaterials, superhydrophobicity and polymer coatings.
