FIB - International Federation for Structural Concrete Health care for the elderly American is among our nation's more pressing social issues. Our society wishes to ensure quality health care for all older people, but there is growing concern about our ability to maintain and improve quality in the face of efforts to contain health care costs. Medicare: A Strategy for Quality Assurance answers the U.S. Congress' call for the Institute of Medicine to design a strategic plan for assessing and assuring the quality of medical care for the elderly. This book presents a proposed strategic plan for improving quality assurance in the Medicare program, along with steps and

timetables for implementing the plan by the year 2000 and the 10 recommendations for action by Congress. The book explores quality of care—how it is defined, measured, and improved—and reviews different types of quality problems. Major issues that affect approaches to assessing and assuring quality are examined. Medicare: A Strategy for Quality Assurance will be immediately useful to a wide audience, including policymakers, health administrators, individual providers, specialists in issues of the older American, researchers, educators, and students. *Envisioning the National Health Care Quality Report* Report of the Quality Assurance in Hospitals Focal Area Putting Research to Work in Quality Improvement and Quality Assurance This document has the background papers from the 1992

AHCPR conference held to formulate a research agenda for quality assurance and improvement. Contents: Executive summary A perspective on quality assurance research Quality improvement / quality assurance taxonomy: a framework Organisational issues and perspectives on quality assurance Quality assurance and quality improvement in the information age Using information in quality improvement and quality assurance What is quality improvement? a report from the field Quality improvement: a patient's perspective Closing quality improvement/assurance information gaps: AHCPR's role Closing quality improvement/assurance information gaps: public and private sector roles Workshop recommendations Appendices. Quality Assurance Quality Assurance in Building Quality Assurance in Hospitals Reliability and Quality Assurance Publication Registries for Evaluating Patient Outcomes

This User's Guide is intended to support the design, implementation, analysis, interpretation, and quality evaluation of registries created to increase understanding of patient outcomes. For the purposes of this guide, a patient registry is an organized system that uses observational study methods to collect uniform data (clinical and other) to evaluate specified outcomes for a population defined by a particular disease, condition, or exposure, and that serves one or more predetermined scientific, clinical, or policy purposes. A registry database is a file (or files) derived from the registry. Although registries can serve many purposes, this guide focuses on registries created for one or more of the following purposes: to describe the natural history of disease, to determine clinical effectiveness or cost-effectiveness of health care products and services, to measure or monitor safety and harm, and/or to measure quality of care. Registries are classified according to how their populations are defined. For example, product registries include patients who have been exposed to biopharmaceutical products or medical devices. Health services registries consist of patients who have had a common procedure, clinical encounter, or hospitalization. Disease or condition registries are defined by patients having the same diagnosis, such as cystic fibrosis or heart failure. The User's Guide was created by researchers affiliated with AHRQ's Effective Health Care Program, particularly those who participated in AHRQ's DEClIDE (Developing Evidence to Inform Decisions About Effectiveness)

program. Chapters were subject to multiple internal and external independent reviews.

Annual Report of the Board of Medical Quality Assurance National Academies Press

How good is the quality of health care in the United States? Is quality improving? Or is it suffering? While the average person on the street can follow the state of the economy with economic indicators, we do not have a tool that allows us to track trends in health care quality. Beginning in 2003, the Agency for Healthcare Research and Quality (AHRQ) will produce an annual report on the national trends in the quality of health care delivery in the United States. AHRQ commissioned the Institute of Medicine (IOM) to help develop a vision for this report that will allow national and state policy makers, providers, consumers, and the public at large to track trends in health care quality. Envisioning the National Health Care Quality Report offers a framework for health care quality, specific examples of the types of measures that should be included in the report, suggestions on the criteria for selecting measures, as well as advice on reaching the intended audiences. Its recommendations could help the national

health care quality report to become a mainstay of our nation's effort to improve health care.

Radiosurgery performed with the "Gamma Knife" or on a linac facility is a specific radiotherapy method to treat certain lesions in the brain with a high single radiation dose. Geometric miss of a radiosurgical target is considered the most likely serious error in a stereotactic radiosurgery treatment. Therefore, the issue of quality assurance in stereotactic radiosurgery is a serious one for neurosurgeons, physicists, patients and those of us who wish to analyze the results of radiosurgery. The purpose of this book is to offer and describe a quality assurance program and procedures of the physical and technical aspects through identifying the sources of possible errors and suggesting quality assurance tests that should be performed in order for a stereotactic system to be used clinically.

The Department of Energy (DOE) must obtain a license from the Nuclear Regulatory Commission (NRC) to construct a nuclear waste repository at Yucca Mountain, Nevada. In licensing, a quality assurance program helps ensure that the information used to demonstrate the safety of the repository is defensible and well documented. DOE developed a corrective action plan in 2002 to fix recurring problems with the accuracy of

such information. This report assesses the status of corrective actions and the adequacy of DOE's plan to measure the effectiveness of actions taken. DOE has reportedly implemented most of the actions in its 2002 corrective action plan, but recent audits and assessments have identified lingering quality problems with data, models, and software and continuing management weaknesses. Audits revealed that some data sets could not be traced back to their sources, model development and validation procedures were not followed, and some processes for software development and validation were inadequate or not followed. DOE believes these problems have not affected the technical basis of the project; however, they could adversely affect the licensing process. Recent assessments identified continuing management weaknesses in the areas of roles and responsibilities, quality assurance policies and procedures, and a work environment that did not foster employee confidence in raising concerns without fear of reprisal. NRC has acknowledged DOE's effectiveness in identifying quality problems, but recently concluded that quality problems could delay the licensing process. DOE cannot assess the effectiveness of its 2002 plan

because the performance goals to assess management weaknesses lack objective measurements and time frames for determining success. The goals do not specify the amount of improvement expected, how quickly the improvement should be achieved, or how long the improvement should be sustained before the problems can be considered corrected. DOE recently developed a measurement tool that incorporates and revises some of the goals from the action plan, but most of the revised goals continue to lack the necessary time frames needed to determine whether the actions have corrected the recurring problems. A recently completed DOE review of the 2002 plan found that the corrective actions have been fully implemented. However, the review also noted the effectiveness of the actions could not be evaluated because many of the plan's goals lacked the level of objectivity and testing needed to measure effectiveness.

Over the years, the World Health

Organization's Expert Committee on Specifications for Pharmaceutical Preparations, originally created to prepare The International Pharmacopoeia, has made numerous recommendations relevant to quality assurance and control for national regulatory and control systems and the implementation of international standards, but for the most part they have only been available in the annexes to various technical reports. In this second of two volumes, those annexes providing guidelines related to good manufacturing practices and to inspection of manufacturers and drug distribution channels have been gathered and revised.
