The use of complementary therapies is exploding, increasing the pressure to establish a rigorous science to support its practice. Clinical Research in Complementary Therapies: Principles, Problems and Solutions provides students with the tools they need to research complementary and integrative medicine (CIM) and so fill this gap. Essential for both undergraduate and postgraduate students, this second edition is significantly updated and enhanced. Part 1 deals with research strategies and

methods, explaining the major types of clinical research in CIM and how these inter-relate. New chapters are included on whole systems research, qualitative research and questionnaire development. Not all therapies can be treated the same way nor channeled through the signal process of randomized controlled trials. Therefore, detailed description of mixed methods approaches including observational, qualitative, cost-benefit and comparative effectiveness research are described. Part 2 deals with specific complementary therapies and how they are invested by experts in each field. The book analyses the key questions asked and the controversies debated in complementary medicine research and offers clear and innovative guidance for answering these questions. FEATURES • Provides an overarching synthesis of methods in CIM and how they are to be used collectively including the role of comparative effectiveness research • Suggests both general and specific factors which need to be considered in assessing or planning complementary therapy research • Pinpoints aspects of research which are different in orthodox research

and complementary therapy research • Reviews the types of research carried out in specific complementary therapies and analyses issues which arise • Includes information on measuring the economic cost and benefits of complementary medicine, clinical audit and the role of placebos use • Builds upon recent research results, looks at the lessons these provide for all complementary therapies and suggests key issues to address in future research. • Provides an overarching synthesis of methods in CIM and how they are to be used collectively including the role of comparative effectiveness research • Suggests both general and specific factors which need to be considered in assessing or planning complementary therapy research • Pinpoints aspects of research which are different in orthodox research and complementary therapy research • Reviews the types of research carried out in specific complementary therapies and analyses issues which arise • Includes information on measuring the economic cost and benefits of complementary medicine, clinical audit and the role of placebos use • Builds upon recent

This book communicates the latest

findings in pediatric orthopedics and answers key everyday questions in the field in an informative, readily understandable manner. The scope is comprehensive, encompassing all aspects of diagnosis and therapy. After an opening section on basic principles, the two main sections discuss diseases and injuries by site and cover systemic conditions including trauma, infections, juvenile rheumatoid arthritis, tumors and hereditary diseases. The book is the translation of the latest edition of the well-known classic Kinderorthopädie in der Praxis, which presents the collected knowledge of experts from Basel University Children's Hospital - Fritz Hefti and his co-workers Reinald Brunner, Carol Claudius Hasler, and Gernot Jundt. This edition has been revised and updated in a variety of ways. New findings are incorporated into all chapters, important advances in treatment are presented and the latest concepts in tumor diagnosis and neuro-orthopedics are discussed. The book contains more than 150 additional illustrations, including new clinical images and radiographs and many further amusing cartoons by Franz Freuler. The

aim is to make children's orthopedics fun - in both practice and theory! The book has received several awards.

**Psychosomatic Medicine** Urbfi  
 Over the last quarter century or so,  
 specialization within obstetrics and  
 gynecology, and pediatrics has resulted in  
 the development of the disciplines of  
 maternal-fetal medicine and neonatology,  
 respectively. A primary focus of maternal-  
 fetal medicine has been to understand the  
 mechanism(s) of premature delivery and  
 develop treatment modalities for  
 improving the length of gestation. A  
 primary focus of neonatology has been to  
 understand the causes of respiratory  
 distress in the neonate. Success has

resulted, not only in the lengthening of  
 gestation, but an improved understanding  
 of the causes and treatment of neonatal  
 respiratory disease. With increasing  
 success has come the necessity to under-  
 stand the metabolic principles of the  
 parturient, the fetal/placenta unit, and the  
 neonate. These principles are clearly very  
 important from multiple aspects.  
 Increased understanding of metabolism of  
 the pregnant woman would explain the  
 aberrations occurring in normal and  
 abnormal pregnancy and improve  
 nutritional support for the parturient. A  
 prime example of altered metabolism is  
 the parturient with diabetes.  
 Understanding metabolism of the  
 fetal/placenta unit is necessary to increase  
 the probability that the fetus will be born  
 appropriate for size irrespective of the  
 gestational age. The various components  
 of neonatal metabolism are important, not  
 only for understanding the changes in  
 physiology and biochemistry occurring in  
 the developing neonate, but the principles  
 by which nutritional support should be  
 provided.
