Anatomy of the Cat: Muscular System
Presenting more than 266 full color anatomic drawings arranged by organ system, this book is dedicated exclusively to feline anatomy with emphasis on those areas of anatomy that are frequently encountered in clinical practice. It includes a highly detailed chapter on special senses which collects and organizes difficult to find information for quick access. Nomenclature is from *Nomina Anatomica Veterinaria* so that the feline anatomy is in line with that used in other textbooks of veterinary anatomy of the domestic animals. The book accurately captures the anatomy pertinent to clinical veterinary medicine.

Mammalian Anatomy: The Cat Legare Street Press
A review from The American Naturalist, Volume 35: FROM the standpoint of teaching anatomy to the beginner,

few animals have received more attention than the cat, and the number of easily accessible books dealing with the structure of this animal is already large. The preparation of a new volume as a competitor in this field is hazardous, to say the least, and the present venture seems all the more so because its authors, Reighard and Jennings, do not propose to treat the subject in any novel way, but content themselves with the simple descriptive methods of the older anatomists. The text embodies a well-arranged systematic description of the organs of the cat. The terminology is for the most part a judicious compromise between the various recent attempts at a revised nomenclature and the older systems. Its innovations are based chiefly on greater convenience in the use of terms, a principle which, though often ignored, eventually makes itself felt in the growth of all nomenclatures. The orthography is said to follow the best English usage, in which case there should have been no finale in "foramen of Monroe." The anatomical descriptions impress the reader as having been

taken directly from the specimen, and, as a rule, show none of the forced character that is so often seen in Mivart's account, where at times human anatomy seems to be directly transferred to the cat. The description of the divisions of the body cavity, however, is distinctly misleading. The reader is told that this cavity is divided by the diaphragm into two parts, an abdominal cavity and a thoracic cavity, and the latter is described in some detail. The thorax of a cat, however, does not contain a single large cavity but three such, one for the heart and one for each lung, and it is only after the scalpel of the student has been at work some time that such a cavity as that described can be said to exist. The impropriety of including such openings in the description of the anatomy of an animal must be obvious, and its only excuse is the bad example set by human anatomists in this respect. Not only are the cavities of the thorax thus unnaturally united, but the abdominal cavity, really one, narrowly escapes being divided in two, a condition which the authors, however, finally imply to be contrary to

fact. The text is illustrated by one hundred and seventy-three original figures, many of which, particularly the drawings of muscles, are models of clearness and accuracy. Some, however, especially those on the brain, lack firmness, and a few, such as Fig. 42, are so shaded that more or less of the lettering can be discovered only by elimination. The descriptive portion of the work is followed by some forty pages of practical directions which give all that is needed for so simple a subject as the dissection of the cat, and the volume is concluded by an index of nearly three thousand entries. Although the book is in a well-worked field, it certainly occupies a unique position, for none of its predecessors can be described as accurate, complete, and compact. These qualities will without doubt place it first among English guides to the anatomy of the cat.

Mammalian Anatomy : a Preparation for Human and Comparative Anatomy : Part I. the Skeleton of the Cat, Its Muscular Attachments, Growth and Variations, Compared With the Skeleton of Man Bryan

Edwards Publishing
The cat has been used as a subject for dissection in the study of mammalian anatomy for almost two centuries. The very popular Pictorial Anatomy of the Cat by Stephen G. Gilbert, originally published in 1967 and now in its 12th printing, has been used in countless laboratories as a guide to dissection and supplement to introductory textbooks. Outline of Cat Anatomy is an abridged version of the original guide, modified for practical use in one-semester courses. It employs anatomical terms used in human rather than veterinary anatomy and includes illustrations of human anatomy that may be compared with those of the cat, especially useful for the many students who do not have access to human dissections. Gilbert's earlier Pictorial Anatomy of the Cat is "an excellent, well-illustrated dissection guide for use in courses in comparative anatomy. The text is informative and accurate, and instructions for dissection are clear and helpful.... Highly recommended."

ALTHOUGH the cat has long been in common use for the practical study of mammalian anatomy, a clear, correct, not too

voluminous account of its structure, such as should be in the hands of students in the laboratory, has remained a desideratum. A number of works have been published on the cat, some of them of much value, yet there is none which fulfils exactly the conditions mentioned. The books which have appeared on this subject are the following: 1. Strauss-Durckheim, H. Anatomie descriptive et comparative du Chat. 2 vols. Paris, 1845. 2. Mivart, St. George. The Cat: an Introduction to the Study of Back-boned Animals, especially Mammals. New York, 1881. 3. Wilder, Burt G., and Gage, Simon H. Anatomical Technology as applied to the Domestic Cat. New York, 1882. 4. Gorham, F. P., and Tower, R. W. A Laboratory Guide for the Dissection of the Cat. New York, 1895. 5. Jayne, H. Mammalian Anatomy. Vol. I. Philadelphia, 1898. The first of these works treats only of the muscles and bones, and is not available for American students. Its excellent plates (or Williams's outline reproductions of the same) should be in every laboratory. The second book named is

written in such general terms that its descriptions are not readily applicable to the actual structures found in the dissection of the cat, and experience has shown that it is not fitted for a laboratory handbook. It contains, in addition to a general account of the anatomy of the cat, also a discussion of its embryology, psychology, palaeontology, and classification. Laboratory Investigations in Anatomy & Physiology

Macmillan

An Atlas of Cat Anatomy can help a student learn twice as much as he could in the same amount of time using only a written description. The book is spiral bound and stands like an easel, taking a minimum amount of space in the work area.

Altogether there are fifty-seven plates featuring the various parts and organ systems in their actual size, making identification remarkably easy. A brief verbal description accompanies each plate.

In addition, the extensive glossary includes synonymous terms, derivations, definitions, and keys to pronunciation.

Cat Musculature

Read Books Ltd

This series of brilliant photographs shows the dissection of the cat musculature. It is designed for use in conjunction with the third edition of Hyman's Comparative Vertebrate Anatomy, edited by Marvalee Wake, although

it can be used with other textbooks. Every possible step has been taken to make the photographs easy to interpret and to follow. Reference indications to the Wake texts are included, and also concise data on the origin, insertion, and action of each muscle. The scale is such that in most cases no more than five muscles are shown per photograph, thus simplifying the task of visualizing the individual muscles. An invaluable aid for every student of cat anatomy.
