If we are to believe in Moore's law, then every passing day brings new and advanced changes to the technology arena. We are as amazed by miniaturization of computing devices as we are amused by their speed of computation. Everything seems to be in flux and moving fast. We are also fast moving towards ubiquitous computing. To achieve this kind of computing landscape, new ease and seamless computing user interfaces have to be developed. Believe me, if you mature and have ever program any digital device, you are, like me, looking forward to this brave new computing landscape with anticipation. However, if history is any guide to use, we in information security, and indeed every

computing device user young and old, must brace themselves for a future full of problems. As we enter into this world of fast, small and concealable ubiquitous computing devices, we are entering fertile territory for dubious, mischievous, and malicious people. We need to be on guard because, as expected, help will be slow coming because ? rst, well trained and experienced personnel will still be dif? cult to get and those that will be found will likely be very expensive as the case is today.

Cryptography is the study and use of strategies for secure communication while third parties, known as adversaries, are present. It is concerned with the development and analysis of protocols that prohibit hostile third parties from accessing information exchanged between two entities, thereby adhering to different elements of information security. A scenario in which a message or data shared between two parties cannot be accessed by an adversary is referred to as secure communication. In cryptography, an adversary is a hostile entity that seeks to obtain valuable information or data by compromising information security principles.
