The Skiing Manual offers instructions on technique and skills from an author with over 30 years of skiing experience. It will cover every type of skiing from cross-country to mountaineering, highlighting the important

differences between genres. It explains the clothing and equipment required for every type of skiing and of course the skis, boots, bindings and poles, as well as skills, snow science, and safety and rescue. It's presented in color with easy-to-follow step-by-step sequences and a wealth of inspirational action photographs. History of skiing - from prehistoric travel to Olympic competition ; Clothing and

equipment for all types of skiing; Learning to ski - carrying and putting on skis, choosing a ski school; Life on the hill - what it's like on the mountain, how to buy a lift pass, and how to get around in the snow; Skiing technique - from snow plough turns to extreme skiing; Ski lifts - the different types, and how to use them; Types of skiing - cross country, telemark, freeskiing and adventure skiing; Mountain safety - avalanches, precautions, equipment and rescue;

Ski culture - Café culture and après ski; Ski travel - skiing around the world, and how to get there; Competition disciplines - downhill, slalom, giant slalom and super G, jumping, freestyle, cross country (and biathlon)

This informative publication is a hands-on reference source for the design of two-stroke engines. The state-of-the-art is presented in such design areas as unsteady gas dynamics, scavenging, combustion, emissions and silencing. In addition, this comprehensive publication features a computer program

appendix of 28 design programs, allowing the reader to recreate the applications described in the book. The Basic Design of Two-Stroke Engines offers practical assistance in improving both the mechanical and performance design of this intriguing engine. Organized into eight information-packed chapters, contents of this publication include: Introduction to the Two-Stroke Engine Gas Flow Through Two-Stroke Engines Scavenging the Two-Stroke Engine

Combustion in Two-Stroke Engines Computer Modelling of Engines Empirical Assistance for the Designer Reduction of Fuel Consumption and Exhaust Emissions Reduction of Noise Emission from Two-Stroke Engines

Manual of Ski Mountaineering Haynes Manuals N. America, Incorporated
2008 Outstanding Academic Title, Choice Magazine From dirt bikes and jet skis to weed wackers and snowblowers, machines powered by small gas engines have become a permanent—and loud—fixture in American culture. But fifty years of high-speed fun and pristine lawns have not come without cost. In the first comprehensive history of the small-bore

engine and the technology it powers, Paul R. Josephson explores the political, environmental, and public health issues surrounding one of America's most dangerous pastimes. Each chapter tells the story of an ecosystem within the United States and the devices that wreak havoc on it—personal watercraft (PWCs) on inland lakes and rivers; all-terrain vehicles (ATVs) in deserts and forests; lawn mowers and leaf blowers in suburbia. In addition to environmental impacts,

Josephson discusses the development and promotion of these technologies, the legal and regulatory efforts made to improve their safety and environmental soundness, and the role of owners' clubs in encouraging responsible operation. Synthesizing information from medical journals, recent environmental research, nongovernmental organizations, and manufacturers, Josephson's compelling history leads to one irrefutable conclusion:

these machines cannot be operated without loss of life and loss of habitat. Lakeland Boating Haynes Publishing UK

Many of the earliest books, particularly those

dating back to the 1900s and before, are now extremely scarce and increasingly expensive. We are republishing these classic works in affordable, high quality, modern editions, using the original text and artwork.

Mountain Travel and Rescue

In the last half-century, high-speed water transportation has developed rapidly. Novel high-performance marine vehicles, such as the air cushion vehicle (ACV), surface effect ship (SES),

high-speed monohull craft (MHC), catamaran (CAT), hydrofoil craft (HYC), wave-piercing craft (WPC) and small water area twin hull craft (SWATH) have all developed as concepts, achieving varying degrees of commercial and military success.

Prototype ACV and SES have achieved speeds of 100 knots in at calm conditions; however, the normal cruising speed for commercial operations has remained around 35-50 knots. This is partly due to increased drag in an average coastal s- way

where such craft operate services and partly due to limitations of the propulsion systems for such craft. Water jets and water propellers face limitations due to cavitation at high speed, for example. SWATH are designed for reduced motions in a seaway, but the hull form is not a low drag form suitable for high-speed operation. So that seems to lead to a problem - maintain water contact and either water propulsion systems run out of power or craft motions and speed loss

are a problem in higher seastates. The only way to higher speed would appear to be to disconnect completely from the water surface. You, the reader, might respond with a question about racing hydroplanes, which manage speeds of above 200 kph. Yes, true, but the power-to-weight ratio is extremely high on such racing machines and not economic if translated into a useful commercial vessel.
