Discusses the structure of the Seven-Eleven Japan supply chain in terms of its facilities network, inventory management, distribution, and information. To discuss how Seven-Eleven has made consistent supply chain choices to support its business strategy of providing convenience to customers. Points to how Seven-Eleven has used information and aggregation in transportation to improve supply chain responsiveness at a relatively low cost.

Givon's new book re-casts pragmatics, and most conspicuously the pragmatics of sociality and communication, in neuro-cognitive, bio-adaptive, evolutionary terms. The fact that context, the core notion of pragmatics, is a framing operation undertaken on the fly through judgements of relevance, has been well known since Aristotle, Kant and Peirce. But the context that is relevant to the pragmatics of sociality and communication is a highly specific mental operation — the mental modeling of the interlocutor's current, rapidly shifting belief-and-intention states. The construed context of social interaction and communication is

thus a mental representation of other minds. Following a condensed intellectual history of pragmatics, the book investigates the adaptive pragmatics of lexical-semantic categories — the 1st-order framing of “reality”, what cognitive psychologists call “semantic memory”. Utilizing the network model, the book then takes a fresh look at the adaptive underpinnings of metaphoric meaning. The core chapters of the book outline the re-interpretation of “communicative context” as the systematic, on-line construction of mental models of the interlocutor’s current, rapidly-shifting states of belief and intention. This grand theme is elaborated through examples from the grammar of referential coherence, verbal modalities and clause-chaining. In its final chapters, the book pushes pragmatics beyond its traditional bounds, surveying its interdisciplinary implications for philosophy of science, theory of personality, personality disorders and the calculus of social interaction.

A Program for You leads each of us--newcomer or old-timer--to a deeper understanding of recovery as a way of life. A Program for You leads each of us--newcomer or old-timer--to a deeper understanding of recovery as a way of life. A Program for You clears our way for discovering positive, powerful answers to these questions. In the years since 1939, the Big Book, Alcoholics Anonymous, has guided millions in their search for a design for healthy living free of addictive behaviors. Now, two program old-timers share their years of intensive study of the Big Book, revealing the vitality of its message for those of us reading it today. This celebration of the basic text of Twelve Step recovery breathes new life into the Big Book's timeless wisdom. Thoroughly annotated line and page, written with down-to-earth humor and simplicity, and providing a contemporary context for understanding, A Program for

You helps us experience the same path of renewal that Bill W. and the first on hundred AA members did.

Vintage Game Consoles tells the story of the most influential videogame platforms of all time, including the Apple II, Commodore 64, Nintendo Entertainment System, Game Boy, Sega Genesis, Sony PlayStation, and many more. It uncovers the details behind the consoles, computers, handhelds, and arcade machines that made videogames possible. Drawing on extensive research and the authors’ own lifelong experience with videogames, Vintage Game Consoles explores each system’s development, history, fan community, its most important games, and information for collectors and emulation enthusiasts. It also features hundreds of exclusive full-color screenshots and images that help bring each system’s unique story to life. Vintage Game Consoles is the ideal book for gamers, students, and professionals who want to know the story behind their favorite computers, handhelds, and consoles, without forgetting about why

they play in the first place – the fun! Bill Loguidice is a critically acclaimed technology author who has worked on over a dozen books, including *CoCo: The Colorful History of Tandy's Underdog Computer*, written with Boisy G. Pitre. He's also the co-founder and Managing Director for the popular Website, *Armchair Arcade*. A noted videogame and computer historian and subject matter expert, Bill personally owns and maintains well over 400 different systems from the 1970s to the present day, including a large volume of associated materials. Matt Barton is an associate professor of English at Saint Cloud State University in Saint Cloud, Minnesota, where he lives with his wife Elizabeth. He's the producer of the "Matt Chat," a weekly YouTube series featuring in-depth interviews with notable game developers. In addition to the original *Vintage Games*, which he co-authored with Bill, he's author of *Dungeons & Desktops: The History of Computer Role-Playing Games and Honoring the Code: Conversations with Great Game Designers*.

Presenting a monumental achievement: 50 years of data cataloging the immediate, long-term, and hereditary effects of atomic radiation on the survivors of the Hiroshima and Nagasaki bombs. Authored by one of the key members of the Atomic Bomb Casualty Commission founded in 1947, this unique work documents the critical findings and conclusions of the longest ongoing medical study in history; it will surely become the foundation for all future investigations and standards regarding the bioeffects of ionizing radiation. "In my opinion, Dr. Schull has written a very interesting and accurate account of the atomic bomb follow-up program in Japan. He writes extremely well, with areas of his particular scientific interest described in great detail. He also describes events and the social implications in a manner that has broad, general appeal." —Stuart C. Finch, MD University of Medicine and Dentistry of New Jersey "A history of the Hiroshima/Nagasaki study is badly needed. I was very happy to hear that Jack Schull was working on such a project, and it is an understatement to say that I am anxious to see it published." —Seymour Jablon,

PhD Bethesda, Maryland "Rarely in the history of a program will one have a nearly 50-year account from an eyewitness and major participant, beginning with the program's onset to the present. Jack's book offers the reader this extraordinary insight into the birth and development of the study of the A-bomb survivors. Moreover, he has served on all major national and international commissions dealing with radiation protection and risk assessment and he interweaves the Japanese studies into the radiation risk issues in a way that few, if any, other contemporary scientists can." —Seymour Abrahamson, PhD Radiation Effects Research Foundation On August 6 and 9, 1945, the only atomic bombs ever used in warfare were dropped on the Japanese cities of Hiroshima and Nagasaki. The destruction and death caused by those bombings presented the world with a vivid portrait of the dangers of the atomic age. However, the thousands of bomb survivors have given scientists a massive, firsthand perspective on the bioeffects of radioactivity. It is the study of these survivors that forms the foundation of the modern understanding of the immediate,

long-term, and hereditary consequences of exposure to ionizing radiation. *Effects of Atomic Radiation: A Half-Century of Studies from Hiroshima and Nagasaki* is the definitive account of the methods, findings, and conclusions of the 50-year study on the survivors of the atomic bomb blasts. It is a truly monumental work, surveying a colossal body of data to offer a comprehensive, unified, and authoritative summary of not only the scientific study itself, but the personal, social, and political factors that have shaped the investigation from its inception. The book goes beyond the simple compilation of facts, giving the reader unique insight into this unprecedented research project and exploring the complex web of subjective perceptions and fears that color popular, national, and even scientific views of radiation exposure in moderate and extreme cases. Authored by Dr. William J. Schull, perhaps the single most influential scientist involved in the studies, this book conveys both his authority and sensitivity. Dr. Schull arrived in Japan in 1949 and was instrumental in the development of the Atomic Bomb Casualty Commission. Since

then, he has been one of the driving forces behind the largest medical follow-up study ever undertaken. His years spent working directly with bomb survivors imbue his narrative with a compelling personal history, and his service on numerous national and international committees studying ionizing radiation give him a broad, authoritative perspective on the implications of the ABCC's work. *Effects of Atomic Radiation: A Half-Century of Studies from Hiroshima and Nagasaki* is first and foremost a scientific work, summarizing the core findings of the definitive study on radiation exposure; while throughout the book, the author provides personal accounts that illustrate the human dimensions of the bombings. In a world where nuclear power is increasing and exposure to radiation is a daily occurrence, this book is essential reading for all scientists associated with public, private, or governmental institutions that set standards of acceptability for exposure.

This Safety Report contains the findings of extensive research in terms of the lessons

that can be learned from accidents which have occurred in industrial radiography, both in developed and developing countries. The review was carried out by a team of regulatory authorities, manufacturers and safety advisers. The objectives were to draw lessons from the initiating events of the accidents, the contributing factors and the consequences, and to identify several measures that, if implemented, would improve safety performance in industrial radiography.

A Third University is Possible unravels the intimate relationship between the more than 200 US land grant institutions, American settler colonialism, and contemporary university expansion. Author la paperson cracks open uncanny connections between Indian boarding schools, Black education, and missionary schools in Kenya; and between the Department of Homeland Security and the University of California. Central to la paperson’s discussion is the “scyborg,” a decolonizing agent of technological subversion. Drawing parallels to Third Cinema and Black filmmaking assemblages, A Third University is Possible ultimately presents new ways of using language to develop a framework for hotwiring university “machines” to the practical work of decolonization.

Networking All-in-One For Dummies WHO Your ultimate one-stop networking reference Designed to replace that groaning shelf-load of dull networking books you’d otherwise have to buy and house, *Networking All-in-One For Dummies* covers all the basic and not-so-basic information you need to get a network up and running. It also helps you keep it running as it grows more complicated, develops bugs, and encounters all the fun sorts of trouble you expect from a complex system. Ideal both as a starter for newbie administrators and as a handy quick reference for pros, this book is built for speed, allowing you to get past all the basics—like installing and configuring hardware and software, planning your network design, and managing cloud services—so you can get on with what

your network is actually intended to do. In a friendly, jargon-free style, Doug Lowe—an experienced IT Director and prolific tech author—covers the essential, up-to-date information for networking in systems such as Linux and Windows 10 and clues you in on best practices for security, mobile, and more. Each of the nine minibooks demystifies the basics of one key area of network management. Plan and administrate your network Implement virtualization Get your head around networking in the Cloud Lock down your security protocols The best thing about this book? You don’t have to read it all at once to get things done; once you’ve solved the specific issue at hand, you can put it down again and get on with your life. And the next time you need it, it’ll have you covered.

Materials for Conservation: Organic Consolidants, Adhesives and Coatings provides an overview of one aspect of materials conservation treatment, particularly the properties of organic consolidants, adhesives, and coatings. The contents of the book are divided into two parts; these parts are background information and survey of polymers. The coverage of the first part includes polymer science and the uses and requirements of applied polymers. The second part covers resins, vinyl, thermoplastics, fillers, and colorants. The text will be most useful to individuals involved in the management and conservation of historic materials, such as museum curators. Materials engineer and polymer chemists will also benefit from the book.

The 2001 report completed a comprehensive review of the risks to offspring following parental exposure to radiation. The review included an evaluation of those diseases which have both hereditary and environmental components. The major finding is that the total hereditary risk to the first generation following radiation is less than one tenth of the risk of fatal carcinogenesis following irradiation. The Committee concluded that a sounder basis now exists for estimating the hereditary risks of radiation exposure. This is due to advances in molecular genetics, and in the evaluation of multifactorial diseases, such as coronary heart disease.

Why is math so hard? And why, despite this difficulty, are some people so good at it? If there's some inborn capacity for mathematical thinking—which there must be, otherwise no one could do it —why can't we all do it well? Keith Devlin has answers to all these difficult questions, and in giving them shows us how mathematical ability evolved, why it's a part of language ability, and how we can make better use of this innate talent. He also offers a breathtakingly new theory of language development—that language evolved in two stages, and its main

purpose was not communication—to show that the ability to think mathematically arose out of the same symbol-

manipulating ability that was so crucial to the emergence of true language. Why, then, can't we do math as well as we can

speak? The answer, says Devlin, is that we can and do—we just don't recognize when we're using mathematical reasoning.
