GIANNA RICH

Art in History/History in Art Penguin
Based on four decades of research by
Professor Andrew Goudie, this volume
provides a state-of-the-art synthesis of
our understanding of desert
geomorphology. It presents a truly

international perspective, with examples
from all over the world. Extensively
referenced and illustrated, it covers such
topics as the importance of past climatic
changes, the variability of different
desert environments, rock breakdown,
wind erosion and dust storm generation,
sand dunes, fluvial and slope forms and
processes, the role of the applied
geomorphologist in desert development

and conservation, and the Earth as an analogue for other planetary bodies. This book is destined to become the classic volume on arid and semi-arid geomorphology for advanced students and researchers in physical geography, geomorphology, Earth science, sedimentology, environmental science and archaeology.

America has always been a composite of racially blended peoples, never a purely white Anglo-Protestant nation. The Mexican American historian Neil Foley offers a sweeping view of the evolution of Mexican America, from a colonial outpost on Mexico's northern frontier to a twenty-first-century people integral to the nation they have helped build. *The Century Dictionary and Cyclopeda:*

Saudi Arabia is at an early stage of its demographic transition to an older population, and so it has an opportunity to prepare early for a rising noncommunicable disease (NCD) epidemic. NCDs, such as cancers, cardiovascular diseases, diabetes, and chronic respiratory diseases and their associated behavioral risk factors—tobacco use, unhealthy diet, and physical inactivity—are an increasing economic and public health challenge. An aging population is expected to significantly increase the prevalence of NCDs and the related demand for costlier health care services. Interventions and reforms to prevent

NCDs, and to minimize current and future treatment costs, are needed now, particularly if Saudi Arabia is to achieve the Vision 2030 goal of increasing life expectancy from 75 years in 2021 to 80 years in 2030. To support strategic planning efforts, *Noncommunicable Diseases in Saudi Arabia: Toward Effective Interventions for Prevention* assesses the latest evidence on the prevalence and risk factors; explores the health and economic burden of NCDs, as well as their impact on human capital; and identifies key gaps in prevention efforts and ways to address these gaps. The book discusses the need for a national master plan for NCD prevention—one that is selective and targeted, with a particular focus on improving the implementation of cost-

effective interventions and achieving results. To be successful, the national master plan will need to take into account the roles of the different stakeholders and their likely responsibilities in implementation. The book will be of interest to all those who work on NCDs in Saudi Arabia and beyond.

In the late 1970s and early 1980s, our nation began to grapple with the legacy of past disposal practices for toxic chemicals. With the passage in 1980 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), commonly known as Superfund, it became the law of the land to remediate these sites. The U. S. Department of Defense (DoD), the nation's largest industrial organization, also recognized that it too had a legacy of contaminated sites. Historic operations at Army, Navy, Air Force, and Marine Corps facilities, ranges, manufacturing sites, shipyards, and depots had resulted in widespread contamination of soil, groundwater, and sediment. While Superfund began in 1980 to focus on remediation of heavily

contaminated sites largely abandoned or neglected by the private sector, the DoD had already initiated its Installation Restoration Program in the mid 1970s. In 1984, the DoD began the Defense Environmental Restoration Program (DERP) for contaminated site assessment and remediation. Two years later, the U. S. Congress codified the DERP and directed the Secretary of Defense to carry out a concurrent program of research, development, and demonstration of innovative remediation technologies. As chronicled in the 1994 National Research Council report, "Ranking Hazardous-Waste Sites for Remedial Action", our early estimates on the cost and suitability of existing technologies for cleaning up contaminated sites were wildly

optimistic. Original estimates, in 1980, projected an average Superfund cleanup cost of a mere \$3.

Chile is nature on a symphonic scale. Diverse landscapes unfurl over a 4300km stretch: parched dunes, fertile valleys, volcanoes, ancient forests, clear rivers, massive glaciers and fjords. Carolyn McCarthy, Lonely Planet Writer.

This book is open access under a CC BY 4.0 license. This book provides a fresh, updated and science-based perspective on the current status and prospects of the diverse array of topics related to the potato, and was written by distinguished scientists with hands-on global experience in research aspects related to potato. The potato is the third most important global food crop in terms of consumption. Being the only vegetatively propagated species among the world's main five staple crops creates both issues and opportunities for the potato: on the one hand, this constrains the speed of its geographic expansion and its options for international commercialization and

distribution when compared with commodity crops such as maize, wheat or rice. On the other, it provides an effective insulation against speculation and unforeseen spikes in commodity prices, since the potato does not represent a good traded on global markets. These two factors highlight the underappreciated and underrated role of the potato as a dependable nutrition security crop, one that can mitigate turmoil in world food supply and demand and political instability in some developing countries. Increasingly, the global role of the potato has expanded from a profitable crop in developing countries to a crop providing income and nutrition security in developing ones. This book will appeal to academics and students of crop sciences, but also policy

makers and other stakeholders involved in the potato and its contribution to humankind's food security.

Squeezed between a vast ocean and the longest mountain range on earth, Chile is 2,600 miles long and never more than 110 miles wide--not a country that lends itself to maps, as Sara Wheeler discovered when she traveled alone from the top to the bottom, from the driest desert in the world to the sepulchral wastes of Antarctica.

Eloquent, astute, nimble with history and deftly amusing, *Travels in a Thin Country* established Sara Wheeler as one of the very best travel writers in the world.
