Atlas of Anesthesia Saunders

This book provides detailed insight into the difficult problem of pediatric airway management. Each chapter focuses on a particular condition in a very practical manner, describing diagnostic procedures and precisely explaining surgical options with the help of high-quality illustrations. Both established treatment modalities and new management concepts are considered in depth, and controversies relating to the most difficult airway reconstructions are discussed. To help the reader, boxes are included to summarize procedures and to list tips, tricks, and traps relevant to daily practice. The contributors to the book have all been directly involved in the management of children with airway disorders and write on the basis of their vast experience. Otolaryngologists, pediatric surgeons, and thoracic surgeons involved in the management of pediatric airway problems, and in particular airway stenosis, will find this book to be a treasure trove of invaluable information and guidance.

Newborn Screening for Cystic Fibrosis

Elsevier Health Sciences

The introduction and widespread implementation of newborn bloodspot screening (NBS) for cystic fibrosis (CF) has offered earlier diagnosis and better outcomes for children with CF in many countries of the world. It represents a paradigm shift in the diagnostic pathway for these families. In contrast to a clinical diagnosis, infants are now referred for diagnostic testing after a positive NBS result. The introduction of NBS has enabled the provision of early appropriate treatment to prevent the

manifestations of the disease. In the near future, early diagnosis will facilitate the prompt use of new CFTR modulator therapies that correct the basic underlying molecular defect. NBS for CF has been a global success but continues to raise questions with many varied approaches and the development of new technologies, in particular the ability to undertake extensive gene examination. Which is the best protocol to achieve high sensitivity and specificity, and how to evaluate and manage infants with inconclusive diagnosis are all subjects of ongoing discussion. It is also open to question: what is the best approach to informing and counselling the parents about a positive or inconclusive NBS result? These questions are not easy to answer and require a balanced solution that reflects the local health care system and may appropriately result in different answers around the globe. The articles in this book try to answer these questions and give an overview of the current state of knowledge in NBS for CF.

This book covers all aspects of diagnostic and therapeutic

bronchoscopy, which go beyond the techniques of inspection, simple lavage and biopsies of the tracheobronchial tree. In a first section, historical aspects as well as the modern use of both rigid and flexible instruments, the set-up of a bronchoscopy unit, anaesthetic techniques, and functional evaluation for patients undergoing interventional bronchoscopy are discussed. A diagnostic section on transbronchial needle aspiration and bronchoscopic ultrasound is followed by extensive coverage of all existing therapeutic techniques: foreign body removal, laser resection, electrocautery, argon plasma coagulation, cryotherapy, brachytherapy, photodynamic therapy, stenting, and a chapter on multi-modality treatment of advanced pulmonary malignancies. A fourth section deals with percutaneous image-guided procedures, percutaneous dilatational tracheostomy, and transtracheal oxygen therapy. The last section provides an in-depth look at emerging bronchoscopic technology, such as autofluorescence, virtual bronchoscopy, and gene therapy. Written by the world's leading authorities in the field and beautifully illustrated, this book presents the state of the art of interventional bronchoscopy. It is recommended reading for pulmonologists, thoracic or ENT surgeons, oncologists and physicians who take an interest in bronchoscopy.
