pharmacotherapeutics principles and content you need to become a safe and effective prescriber with *Lehne's Pharmacotherapeutics for Advanced Practice Providers*. This new text is built on the same solid foundation of clearly explained, up-to-date, and clinically current content as the undergraduate-level *Lehne's Pharmacology for Nursing Care*, yet carefully focuses on the specific principles and drug content needed by primary and acute care nurse practitioners, physician assistants, and clinical nurse specialists. Three introductory chapters provide foundational content in the areas of prescriptive authority, rational drug selection, prescription writing, and promoting positive

outcomes of drug therapy. Core chapter content centers on the drugs that advanced practitioner prescribers will see most commonly in clinical practice. Introductory chapters tailored to the specific needs of advanced practice prescribers cover topics such as prescriptive authority, rational drug selection and prescription writing, and promoting positive outcomes of

drug therapy. Carefully focused pharmacotherapeutic content reflects the drugs most commonly seen and used by advanced practice prescribers, with emphasis not on the first drug discovered or developed in each class but on the agents most often used today. Primary care drugs are addressed first in each chapter as appropriate, followed by and acute care drugs. UNIQUE! Prescriber-focused pedagogical aids further reinforce the most important information for advanced practice prescribers. Black Box Warnings alert you to special warnings and precautions related to particular drugs. Integrated coverage of Canadian trade names appears throughout

the text and is highlighted with a familiar maple-leaf icon. Integrated coverage of interprofessional collaboration addresses the growing global interest in interprofessional collaboration and incorporates opportunities for interprofessional collaborative practice throughout. Acne is one of the commonest skin diseases that primary care/family physicians and dermatologists have to treat.

Confirming the diagnosis is rarely a problem and given the wide spectrum of treatment options there really is no reason why most patients with acne cannot be helped enormously. However, the vast number of therapeutic options

now available can pose difficulties for the prescribing clinician in deciding which is the preferred treatment. The purpose of this book is to highlight several features of the disease including etiology and clinical presentation whilst also reviewing the treatments available along with their respective modes of action and potential adverse effects.

The series “Clinical Approaches and Procedures in Cosmetic Dermatology” intends to be a practical guide in Cosmetic Dermatology.

Procedures in cosmetic dermatology are very popular and useful in medicine, indicated to complement topical and oral treatments not only for photodamaged skin but also for other dermatosis such as acne, rosacea, scars, etc. Also, full-face treatments using peeling, lasers, fillers and toxins are increasingly being used, successfully substituting or

postponing the need for plastic surgeries.

Altogether, these techniques not only provide immediate results but also help patients to sustain long-term benefits, both

preventing/treating dermatological diseases and maintaining a healthy and youthful skin.

Throughout this series, different treatments in Cosmetic Dermatology will be discussed in detail covering the use of many pharmacological groups of cosmeceuticals, the new advances in nutraceuticals and emerging technologies and procedures. This volume, entitled “Daily Routine in Cosmetic Dermatology” will be an important tool for aesthetic doctors,

practicing dermatologists, plastic surgeons, and all other physicians interested in the field of aesthetic medicine. It discloses in detail the semiology and general treatments in cosmetic dermatology, providing the state-of-the-art regarding patients' evaluation, photoprotection, nutraceuticals and cosmeceuticals and special prescriptions. Also check the other volumes: Volume II - Chemical and Physical Peeling Volume III - Lasers, Lights and Other Technologies Volume IV - Botulinum Toxins, Fillers and Related Substances **Acne** Grada Publishing, a.s. Evaluates the strength and significance of evidence linking use of combined oral

contraceptives to an increased risk of cardiovascular disease in women. Recommendations and conclusions reflect the consensus reached by a group of scientists, including researchers directly involved in several recent large-scale investigations of cardiovascular disease and hormone contraception. The experts also considered evidence that other factors, such as smoking, hypertension, diabetes, age, and family history, might influence the risk of cardiovascular disease in users of combined oral contraceptives. In view of major recent changes in the hormonal content of these contraceptives and the prescribing patterns of providers,

the assessment concentrates on data collected after 1980. The experts also aimed to determine whether the risk of disease is influenced by the estrogen or progestogen content of different preparations. To facilitate the comparison and interpretation of study results, the report opens with a discussion of the strengths and weaknesses of the different epidemiological approaches used to assess the safety of steroid contraceptives. Also discussed is the important distinction between the use of relative risk to examine epidemiological associations and the use of absolute risk to examine clinical importance. Against

this background, the main part of the report examines the strength of evidence linking steroid contraceptives to an increased risk of acute myocardial infarction, ischaemic stroke, haemorrhagic stroke, and venous thromboembolism. Studies of combined oral contraceptives and progestogen-only contraceptives are considered separately for each disease. An effort is also made to determine whether conclusions, based on studies conducted in industrialized countries, are also valid for women living in the developing world. The assessment of findings from epidemiological studies is complemented by a review of possible biological explanations for the effects of

combined oral contraceptives on cardiovascular functions. On the basis of all available evidence, the report concludes that mortality rates from cardiovascular disease are extremely low among women of reproductive age and that the added risk of using steroid contraceptives is also very low in users who do not smoke or have other risk factors for cardiovascular disease. A final section places these risks in perspective and offers balanced advice useful to providers of family planning when helping women to make informed choices about the use of hormonal contraceptives.
