For the first time, a 60-person team of internationally renowned editors and authors presents a textbook of osteopathic medicine that is oriented towards clinical symptoms. Introductory chapters on history, philosophy and the spread of osteopathy are followed by a presentation of its scientific basis that clearly demonstrates how firmly osteopathy is rooted in science. Further chapters cover osteopathic research, diagnosis and principles of treatment. Two parts on therapeutic strategies in osteopathic practice form the core of this book. The first is divided into regions of the body, the second into clinical specialties that offer opportunities for osteopathic treatment. In both clinical parts, osteopathic therapy is presented in the entirety in which it is actually practiced - without the common but artificial separation of parietal, visceral and craniosacral treatment. First, the clinical symptom is explained from a medical perspective, then the osteopathic perspective and treatment is presented. Thus, the title is not only suitable for conveying a profound understanding of osteopaths in training, be they doctors or non-medical practitioners, but also as a clinical reference of osteopathic medicine for everyday treatment.

This handbook presents the state of the art of quantitative methods and models to understand and assess the science and technology system. Focusing on various aspects of the development and application of indicators derived from data on scholarly publications, patents and electronic communications, the individual chapters, written by leading experts, discuss theoretical and methodological issues, illustrate applications, highlight their policy context and relevance, and point to future research directions. A substantial portion of the book is dedicated to detailed descriptions and analyses of data sources, presenting both traditional and advanced approaches. It addresses the main bibliographic metrics and indexes, such as the journal impact factor and the h-index, as well as altmetric and webometric indicators and science mapping techniques on different levels of aggregation and in the context of their value for the assessment of research performance as well as their impact on research policy and society. It also presents and critically discusses various national research evaluation systems. Complementing the sections reflecting on the science system, the technology section includes multiple chapters that explain different aspects of patent statistics, patent classification and database search methods to retrieve patent-related information. In addition, it examines the relevance of trademarks and standards as additional technological indicators. The Springer Handbook of Science and Technology Indicators is an invaluable resource for practitioners, scientists and policy makers wanting a systematic and thorough analysis of the potential and limitations of the various approaches to assess research and research performance.

A certain standardization has now been introduced into the operative techniques of vascular surgery after the stormy developments of the last few decades. It is to make the knowledge gained in those years more widely available that this operative manual Vascular Surgery has been compiled. It contains contributions from numerous authors at European centers of vascular surgery. Both the

young surgeon in training and the more experienced surgeon continuing training will find in this book all the necessary instructions for the diagnosis, preoperative preparation, and reconstructive surgery of the arteries, veins, and lymph vessels (the coronary vessels are excluded from this book, as they are covered separately). The chapters are structured according to a uniform scheme, with sections on special anatomy, indications, surgical tactics, and operative technique. The dynamics of individual operations are illustrated, step by step, in sequences of clear, multicolored figures. Aftercare and alternative angiologic therapies are covered. The vascular surgeon will find here new variants on the usual operative techniques and much stimulating discussion of complications and their prevention and treatment.

The HIB 79 Congress is the second one organized by the European Federation for I-medical Informatics (EFMI). The host society is the "Deutsche Gesellschaft für I-medizinische Dokumentation, Informatik und Statistik (GMDS) who are holding their 24th annual meeting at this time. The program of MIB 79 covers every aspect of the application of information science to medicine and public health, and as such represents the state of the art. Medical Informatics (M. I. ) is now at a turning point. To date, despite the efforts made by specialists in many countries, the balance sheet of M. I. remains rather poor. One of the reasons for this situation is the fact that the computers of yesterday were the prerogative of an elite of users. They were expensive, difficult to use, remote from the users, and mainly in the hands of a sacerdotal caste of data processing specialists. In the future, data processing facilities will be cheap, easy to handle, and immediately accessible. Data processing will have a chance of becoming truly democratic thanks to two important and complementary trends in computer technology: 1. a network due to computer communication partnership; 2. miniaturization due to the dramatic expansion of micro-processor and computer technology. IV The combination of these two main hardware achievements for which some neologisms have been invented - "compunication" \ in the USA and "telEnnatique" in France - will lead to a completely new way of processing data which may be called "distributed informatics."

The genetic era has given rise to significant legal dilemmas: who may own genetic data, when can a genetic test be performed on children, how can genetic-based discrimination be avoided, or to what extent and in what ways can genetic data be protected? The book addresses the social, ethical, and legal implications of collecting, storing, analyzing, and commercializing genetic information. Prominent biologists, medical doctors, lawyers, anthropologists, philosophers, sociologists, and theologians from different countries provide their views on the complex biological and social impacts of the imminent proliferation of genetic information. The authors explore the various uses and applications of genetic information, and discuss the current dilemmas of making laws in the field of genetics. Different models of national genome projects and biobanks, as well as the related international legal documents and national laws are also discussed. Various genome projects and biobanks are analyzed in detail.
