Treatment Resource Manual for Speech-Language Pathology, Sixth Edition Corwin Press

Therapy for young children who stammer is now high priority, with growing research evidence supporting early intervention. This manual from the Michael Palin Centre for Stammering Children (MPC) is a detailed, step-by-step guide intended to support general and specialist speech and language therapists in developing their

confidence and skills in working with this age group. This manual is based on a strong theoretical framework which explains the factors contributing to the onset and development of stammering and describes recent research findings regarding the nature of stammering in this age group. It provides a comprehensive guide to the assessment process and helps to identify which children are likely to recover naturally and which are at risk of developing a persistent stammering problem. The therapy approach has been successfully tried and tested at the Michael Palin Centre, and the manual

provides detailed descriptions of the therapy process. It also includes a supporting CD-Rom and photocopiable resources such as assessment and therapy forms and parents' handouts. The MPC approach is a combination of indirect therapy methods. The indirect therapy component is aimed at helping parents through the use of video feedback, to identify interaction strategies that support their child's fluency and enhance it in the home environment. In addition the approach addresses other concerns, for example, in relation to confidence building, dealing with sensitive children,

and establishing clear structures and boundaries to enhance family relationships. For children at increased risk of persistence, this manual incorporates a direct therapy programme which involves teaching the child strategies for developing fluency. This manual disseminates the MPC's specialist therapy knowledge and research findings, and is an invaluable guide for all speech and language therapists and students working with stammering.

Speech and Language: Volume 1, Advances in Basic Research and Practice is a compendium of papers that discusses the processes and pathologies of, as well as applies theories and clinical issues to, speech and language. Some papers discuss perception of speech in early infancy, the problems faced by speech clinicians, and the anatomy of the perioral motor system. Based on data compiled on the infant's perception of speech sounds, one paper notes that human infants discriminate depending on fine temporal and frequency changes in a complex auditory array. Infants also show

perceptual constraints while listening to speech characterized as adult-like; they are also predisposed to perceive certain speech-sound categories such as vowel and fricative categories. One paper examines the suggestion of Kent (1976) that "acoustic characteristics of children's speech...hold the promise of sensitive methods for the study of speech maturation and developmental disorders." This investigation involves the following: the recent attempts at multidimensional analyses of speech and perception; a measure of perceptual contrast; and results of feature comparison efforts. The compendium is well suited for linguists, ethnologists, psychologists, and researchers whose works involve linguistics, language learning, communications, and syntax.
