Fundamentals of Mathematics is a work text that covers the traditional study in a modern prealgebra course, as well as the topics of estimation, elementary analytic geometry, and introductory algebra. It is intended for students who: have had previous courses in prealgebra wish

to meet the prerequisites of higher level courses such as elementary algebra need to review fundamental mathematical concepts and techniques This text will help the student develop the insight and intuition necessary to master arithmetic techniques and manipulative skills. It was written with the following main objectives: to provide the student with an understandable and usable source of information to provide the student with the maximum opportunity to see that arithmetic concepts and techniques are logically based to instill in the student the understanding and intuitive skills necessary to know how and when to use particular arithmetic concepts in subsequent material courses and nonclassroom situations to give the students the ability to correctly interpret arithmetically obtained results We have tried to meet these objects by presenting material dynamically much the way an instructor might present the material visually in a classroom. (See the development of the concept of addition and subtraction of fractions in section 5.3 for examples) Intuition and understanding are some of the keys to creative thinking, we believe that the material presented in this text will help students realize that mathematics is a creative subject.

This is a practically-oriented text that utilizes current issues as a way to engage students and illustrate the relevance and importance of assessment. This text focuses on a teacher's needs and on assessment solely in the classroom environment. Since many assessment texts today are written by experts in statistics and cover the topic of assessment in many settings with complicated terminology, the practical approach of ASSESSMENT IN THE CLASSROOM appeals to instructors who find it difficult to get their students interested in the subjects of testing and measurement. The authors detail traditional testing methods as well as newer forms of alternative assessment, which evaluates students on their abilities to use their knowledge in realistic situations. Areas covered include: the history of measurement in education, basic concepts, how to assess, what to assess, assessment procedures, and external testing programs, as well as how to set up and measure the latest portfolio assessment method. Many sample forms and examples of various types of assessment provided."

Reducing carbon dioxide (CO₂) emissions is imperative to stabilizing our future climate. Our ability to reduce these emissions combined with an understanding of how much fossil-fuel-derived CO₂ the oceans and plants can absorb is central to mitigating climate change. In *The Carbon Cycle*, leading scientists examine how atmospheric carbon dioxide concentrations have changed in the past and how this may affect the concentrations in the future. They look at the carbon budget and the "missing sink" for carbon dioxide. They offer approaches to modeling the carbon cycle, providing mathematical tools for predicting future levels of carbon dioxide. This comprehensive text incorporates findings from the recent IPCC reports. New insights, and a convergence of ideas and views across several disciplines make this book an important contribution to the global change literature.
