Angioedemas are characterized by the sudden onset of swelling in the deep dermis and subcutis. Their causes include allergic reactions, autoimmune mechanisms, infections and non-allergic/pseudo-allergic hypersensitivity reactions.

Angioedemas often occur concomitantly

with urticaria. The following topics are discussed in the present book: - Treatment of Allergic Angioedemas - Emergency Therapy for Angioedemas - Clinical Manifestation and Therapy for Hereditary Angioedemas - Treatment of Hereditary Angioedemas in Children - Acute Phase Proteins in Kinin-Induced Angioedema - Bradykinin and the Kallikrein-Kinin System - Drugs Affecting the Kallikrein-Kinin System - RAAS Blockers and Bradykinin Metabolism - Therapeutic Effects of ACE Inhibitors.

This is the second edition of a well-received book that has been recommended for

inclusion in any vascular library or vascular radiology suite. The first edition has been fully revised so as to provide a comprehensive, up-to-date account of vascular ultrasound that reflects recent advances. The emphasis remains on the clinical aspects most relevant to angiologists and vascular surgeons. Ultrasound anatomy is discussed, examination procedures explained, normal and pathological findings described, and the clinical impact of ultrasound assessed. Atlas sections present pertinent case material to illustrate typical ultrasound findings for both the more common vascular diseases and rarer conditions. This book will serve not only

as an invaluable guide for beginners, but also as an indispensable reference for experienced sonographers, who will benefit from the detailed evaluation of the role of ultrasound as compared with other modalities and the discussion of ultrasound findings in their clinical context. *English for Doctors* Elsevier Health Sciences

 Discovery and Relative Importance of Continuous Arteriovenous Hemofiltration Lee W.

Henderson Continuous arteriovenous hemofiltration (CAVH) has seen a brisk upswing in popularity in Europe since its introduction by Dr. Kramer and colleagues from Gottingen, West Germany in 1977 [1]. In the United States, the technique received approval as a clinical tool from the Food and Drug Administration in April 1982. This approval flowed, in no small measure, from the extensive experience reported from Europe and in particular West Germany [e. g., 2, 3]. Reports of its clinical utility now have begun to appear in the United States [4]. Removal of excess total body water using synthetic membranes in an extracorporeal circuit dates back to the work

of Alwall and the artificial kidney that he designed which permitted utilization of a hydrostatic pressure gradient to motivate water flow across the membrane [5]. Kolff's original rotating drum with its unencased membrane required an osmotic driving force [6]. Hemofiltration, the use of the filtration process to remove uremic solutes with the artificial kidney, in analogy with the glomerulus, was reported in 1967 [7]. This was made possible by the availability of synthetic membranes with far higher hydraulic permeability (approximately 10 times higher) than conventionally used cellulosic hemodialysis membrane. Specific applications of these "high flux" membranes

to the removal primarily of excess total body water followed shortly thereafter [8].

Major strides have been made in face processing in the last ten years due to the fast growing need for security in various locations around the globe. A human eye can discern the details of a specific face with relative ease. It is this level of detail that researchers are striving to create with ever evolving computer technologies that will become our perfect mechanical eyes. The difficulty that confronts researchers stems from turning a 3D object into a 2D

image. That subject is covered in depth from several different perspectives in this volume. Face Processing: Advanced Modeling and Methods begins with a comprehensive introductory chapter for those who are new to the field. A compendium of articles follows that is divided into three sections. The first covers basic aspects of face processing from human to computer. The second deals with face modeling from computational and physiological points of view. The third tackles the advanced methods, which include illumination, pose, expression, and more. Editors Zhao and Chellappa have compiled a concise and necessary text for

industrial research scientists, students, and professionals working in the area of image and signal processing. Contributions from over 35 leading experts in face detection, recognition and image processing Over 150 informative images with 16 images in FULL COLOR illustrate and offer insight into the most up-to-date advanced face processing methods and techniques Extensive detail makes this a need-to-own book for all involved with image and signal processing
